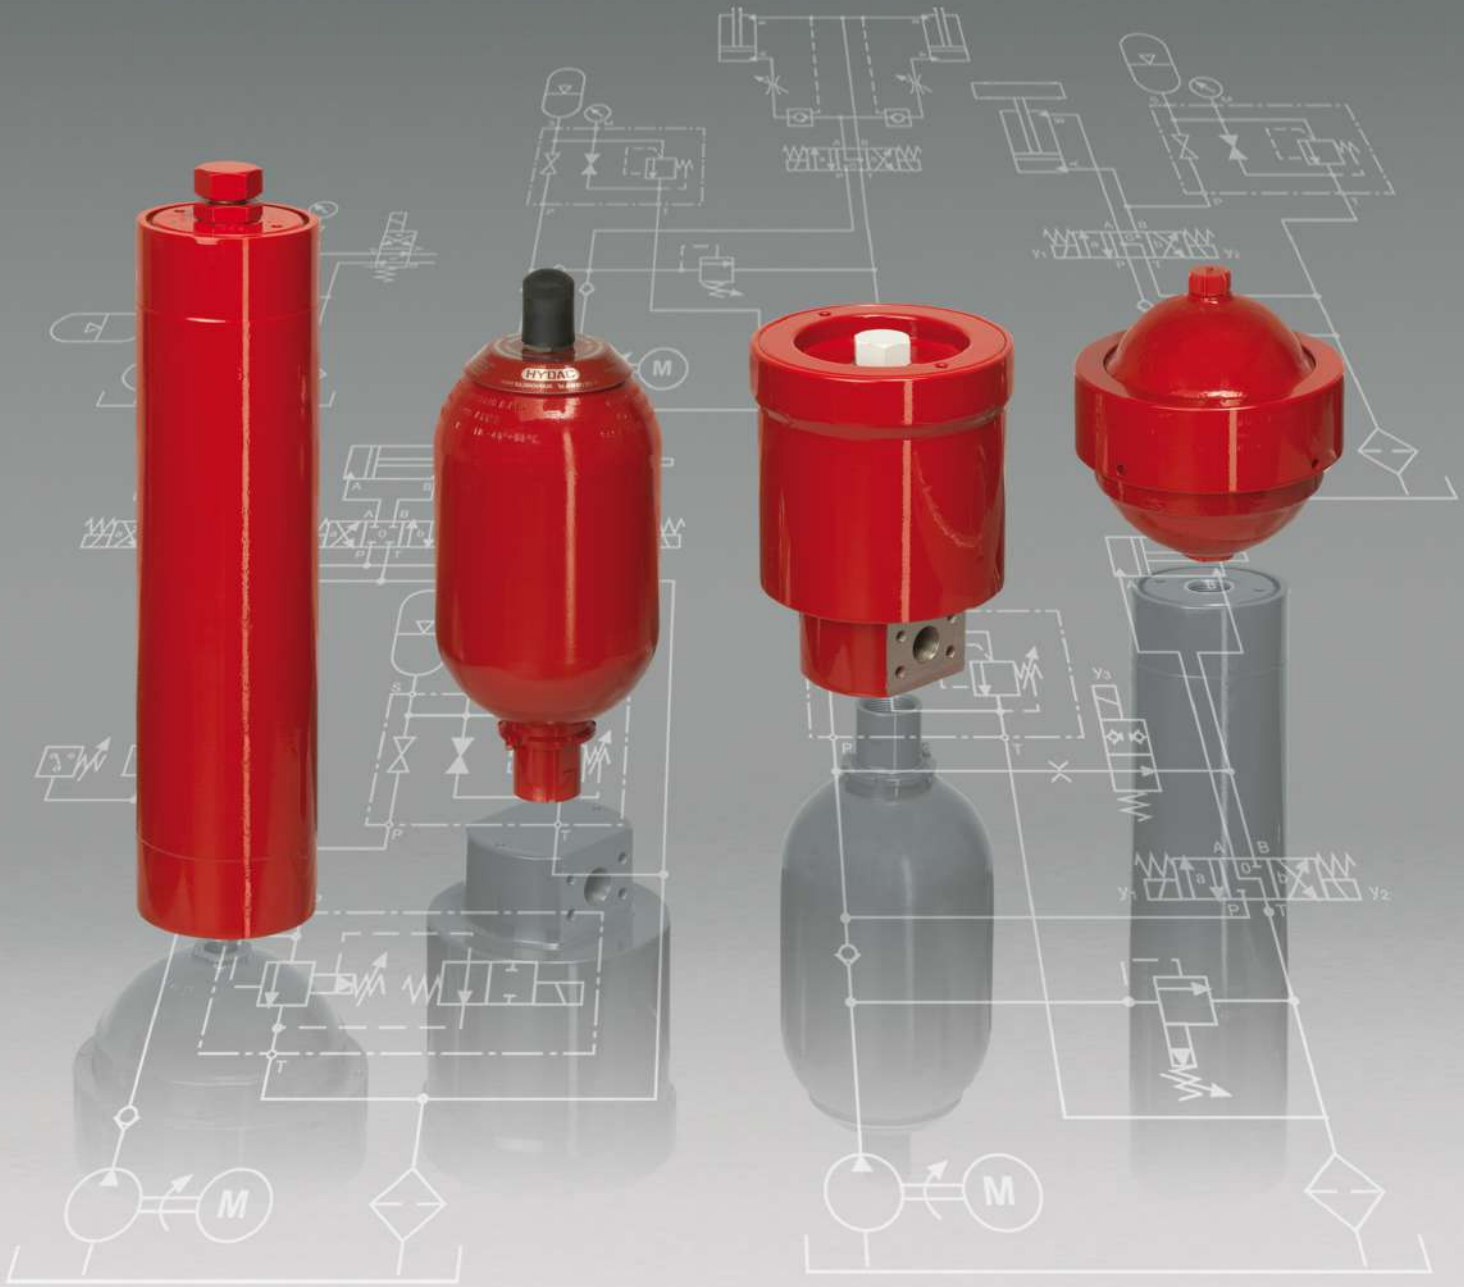
Accumulator Technology. Product Catalogue.



HYDAC Accumulator Technology. Product Catalogue.

EN 30.000.6/04.21

1. HYDAC ACCUMULATOR TECHNOLOGY FLUID ENGINEERING EFFICIENCY VIA ENERGY MANAGEMENT.

HYDAC Accumulator Technology has many years' experience in the research & development, design and production of hydraulic accumulators.

All of HYDAC'S bladder, piston, diaphragm and metal bellows accumulators are part of an unbeatable product range which supports hydraulic systems in almost all sectors at a component or unit level.

The main applications of our accumulators are:

- Energy storage
- Emergency and safety functions
- Damping of vibrations, fluctuations, pulsations (pulsation dampers), shocks (shock absorbers) and noise (silencers)
- Suction flow stabilisation
- Media separation
- Volume and leakage oil adjustment
- Weight equalisation
- Energy recovery

Accumulators improve the performance of the entire system. Here are some of their advantages in more detail:

- Improved functions
- Increased service lives
- Reductions in operating and maintenance costs
- Reductions in pulsations and noise

On the one hand, this means greater safety and comfort for the operator and the machine.

On the other hand, HYDAC accumulators enable efficient working in all applications.

Basic criteria, such as the:

- Design pressure,
- Design temperature,
- Fluid displacement volume,
- Discharge / charging velocity,
- Fluid,
- Acceptance specifications and
- Mounting options

are all important parameters which enable the correct accumulator size to be chosen.

Our accumulator specialists will also use their technical expertise to help you select the right type of accumulator. The comprehensive range of HYDAC accessories simplifies installation and maintenance according to the specification.

2. QUALITY

Quality, safety and reliability are paramount for all HYDAC accumulator components.

They comply with the current regulations (or standards) for pressure vessels in the individual countries of installation.

HYDAC customers can therefore be assured to receive a high-quality accumulator product which can be used in every country in the world, depending on the certification.

For more details, please turn to section 4.

All the processes involved, from development, engineering and production to approval and delivery are defined by HYDAC's certified management system and the relevant international accreditation for the manufacture of pressure vessels.

In conjunction with the customer service department at HYDAC's headquarters, service is possible worldwide.

HYDAC's worldwide distributor network means that trained staff are close at hand to help our customers.

This ensures that HYDAC customers have the support of an experienced workforce both before and after sale.

3. SAFETY INFORMATION

Hydraulic accumulators are closed vessels that are designed and built to hold pressurised fluids. They are charged with nitrogen which is separated from the fluid section by a piston, bladder or diaphragm. Hydraulic accumulators are specifically designed to store and then discharge pressurised fluids.

The regulations for the commissioning and operating of hydraulic accumulators which are in force at the place of installation must be observed. The plant operator is solely responsible for ensuring compliance with these regulations.

Relevant instructions are provided in the operating instructions for our products.

Manufacturers of hydraulic accumulators and products with hydraulic accumulators must observe the following principles:

- Removal or reduction of risks, insofar as this is reasonably possible
- Implementation of appropriate protective measures against risks which cannot be eliminated
- If required, user training regarding any residual risks and the appropriate special measures for reducing these risks during installation and/or operation.

For safe handling and operation, the operator must draw up a risk assessment for the installation site which focuses on the interaction with other components and risks.

The measures which result from this risk assessment must be implemented accordingly.

In the case of fundamental risks affecting hydraulic accumulators, e.g.

- Excessive pressures
- Increases in temperature (in the event of fire)

we already have the relevant products available.

On no account must any welding, soldering or mechanical work be carried out on the accumulator. After the hydraulic line has been connected, it must be completely vented. Work on systems with hydraulic accumulators (repairs, connecting pressure gauges etc.) must only be carried out once the fluid pressure has been released.

3.1. RISK OF EXCESSIVE PRESSURE

Products:

Safety and shut-off block for the fluid side in various sizes and designs.

See catalogue section:

- SAF/DSV safety and shut-off block No. 3.551

Gas safety valve and gas safety block for the gas side

Burst discs for gas and fluid sides

See catalogue section:

- Safety equipment for hydraulic accumulators No. 3.552

3.2. RISK OF RISE IN TEMPERATURE

Products:

Safety and Shut-off Block with solenoid-operated valve (open when de-energised) in conjunction with temperature monitoring.

See catalogue section:

- SAF/DSV safety and shut-off block No. 3.551 or on request

Temperature fuses

See catalogue section:

- Safety equipment for hydraulic accumulators No. 3.552

4. REGULATIONS

4.1. EUROPEAN PRESSURE EQUIPMENT DIRECTIVE (PED)

The European Directive 2014/68/EU came into effect in July 2016. It replaces Directive 97/23/EC and governs the design, fabrication, conformity assessment and placing on the market of pressure equipment and assemblies with a maximum permitted pressure of more than 0.5 bar. It guarantees free movement of goods within the European Community. The EU member states are not permitted to prohibit, restrict or hinder pressure equipment being placed on the market and put into service on the basis of pressure-related risks, provided that the equipment in question meets the requirements of the European Pressure Equipment Directive, has undergone a conformity assessment and is labelled with a CE marking.

Hydraulic accumulators with a capacity of **V ≤ 1 l** and a maximum permitted pressure **PS ≤ 1000 bar** or a pressure capacity **PS • V ≤ 50 bar • l** for gases of fluid group 2 (non-hazardous fluids) are subject to Article 4, section 3 of the European Pressure Equipment Directive and do not receive the CE marking.

Inspection, installation, operational safety and repeat testing of equipment are controlled as before by national laws.

The equipment relating to safety is described in AD2000, ISO 4126 and EN 14359.
The repeat testing intervals are stipulated in the new German industrial health and safety regulations.

4.2. OTHER REGULATIONS

Pressure accumulators which are installed overseas (outside the EU) are supplied with the relevant test certificates required in the country of installation.

HYDAC pressure vessels can be supplied with virtually any test certificate.

Depending on the authority, different material requirements must be observed

Details of some selected approvals are as follows:

4.2.1 CERTIFICATE CODE = S (ASME)

Since 1985, HYDAC Technology GmbH has been authorised to label pressure equipment that has been manufactured in compliance with the ASME regulations with the "ASME" certification mark.

U

Such pressure equipment may be placed on the market in the jurisdiction (application area) of the National Board of Boiler and Pressure Vessel Inspectors.

4.2.2 CERTIFICATE CODE = P (KHK certificate)

For the Japanese market, HYDAC Technology GmbH has had approval as a "Self Inspecting Manufacturer" since the year 2000. Consequently, HYDAC is authorised to manufacture and test pressure vessels for the Japanese market and to import them into Japan.

4.2.3 CERTIFICATE CODE = A9 (MANUFACTURER LICENSING CHINA)

Since 1998 HYDAC Technology GmbH has had approval from the Chinese authority "SELO" as a manufacturer of pressure vessels and valves.

4.2.4 CERTIFICATE CODE = A11 (KGS code)

Since concluding the registration procedure in 2012, HYDAC Technology GmbH is authorised to supply pressure vessels and safety equipment according to the Korean Gas Safety (KGS) Code for Korea.

4.2.5 CERTIFICATE CODE = A6 (TR-CU)

Since 2014, the TR-CU 032/2013 regulation (technical regulation of the customs union "on the safety of pressure equipment") has applied for the countries of the Eurasian Economic Community.

HYDAC Technology GmbH has been certified in accordance with the regulation to supply its product range.

4.3. CERTIFICATE TABLE

The following table lists the codes recommended for use in the model code for different countries of installation.

The country of installation must be stated at the time of ordering (see code in Model Code for the particular product: Certificate Code).

Countries not included in the list may be possible on request. Alternative test certificates and differing values may also be possible on request.

European member states and EFTA states	Certificate code (CC)
Austria	U
Belgium	
Bulgaria	
Cyprus	
Czech Republic	
Denmark

USA	S

1) Registration required in the individual territories or provinces

Others on request.

4.4. TRANSPORT REGULATIONS FOR PRESSURE VESSELS

The transport of gas-filled hydraulic accumulators must be carried out with the utmost care and in compliance with all relevant transport safety regulations (e.g. on public roads, dangerous goods regulations, etc.).

The operating instructions must be observed!

5. PRODUCT OVERVIEW

The following overview shows the standard product range of HYDAC hydraulic accumulators.
For other models and sizes, please contact us.

5.1. BLADDER ACCUMULATORS

5.1.1 **Low pressure**
Permitted operating pressure:
up to 40 bar

Nominal volume:
2.5 ... 450 l

5.1.2 **Standard design**
Permitted operating pressure:
up to 550 bar

Nominal volume:
0.5 ... 200 l

5.1.3 **High pressure**
Permitted operating pressure:
up to 1000 bar

Nominal volume:
1 ... 50 l
Other volumes on request

5.2. PISTON ACCUMULATORS

5.2.1 **Standard design**
Permitted operating pressure:
210 ... 350 bar

Nominal volume:
up to 3300 l

5.2.2 **Series SK280**
Permitted operating pressure:
280 bar

Nominal volume:
0.16 ... 15 l
Other volumes on request

5.2.3 **High pressure**
Permitted operating pressure:
up to 1000 bar

Nominal volume:
up to 50 l

5.3. DIAPHRAGM ACCUMULATORS

5.3.1 **Diaphragm accumulators Weld and screw type**
Permitted operating pressure:
up to 750 bar

Nominal volume:
up to 4 l

Advantages of HYDAC bladder accumulators:

- High discharge speeds
- No pressure difference between fluid side and gas side
- Compact, low-maintenance
- High charge and discharge frequencies

Advantages of HYDAC piston accumulators:

- Minimal pressure difference between fluid side and gas side
- Large effective volumes
- Variable installation positions
- Monitoring of the piston position is possible using a variety of systems
- Particularly suitable for back-up configurations
- Extreme flow rates
- No sudden discharge of gas when seals are worn

Advantages of HYDAC diaphragm accumulators:

- Function-optimised and weight-optimised design
- Unlimited choice of installation positions
- No pressure difference between fluid side and gas side
- Low-maintenance and long service life

5.4. METAL BELLOWS ACCUMULATORS

5.4.1 **Metal bellows accumulators**

Please contact us

Advantages of the HYDAC metal bellows accumulator:

- Durable
- Wear-free
- Media resistance over a wide range of temperatures

See also flyer:

- Heavy diesel engines - Metal bellows accumulators No. 10.129.1

5.5. HYDRAULIC DAMPERS

5.5.1 **Dampers**

Permitted operating pressure:
10 ... 1000 bar

Nominal volume:
0.075 ... 450 L

5.5.2 **Silencers**

Permitted operating pressure:
330 bar
Others on request

Advantages of the HYDAC hydraulic damper:

- Reduces pressure pulsations
- Improves the suction performance of displacement pumps
- Prevents pipe breaks and damage to valves
- Protects measuring equipment and its function in the system
- Reduces noise level in hydraulic systems
- Lowering of servicing and maintenance costs
- Increase in service life of the system

5.6. SPECIAL ACCUMULATORS

5.6.1 **Weight-reduced accumulators**

Over 80 % reduction in weight compared to equivalent carbon steel accumulators.

The selection ranges from weight-optimised accumulators, e.g. by using aluminium, through to light-weight and ultra light-weight accumulators.

See also flyer:

- Weight-reduced accumulators No. 3.305

5.6.2 **Spring accumulators**

Fitted with a spring.
The energy is produced by the spring force, instead of gas.

Further information on request.

Advantages of the HYDAC spring accumulator:

- No gas losses
- Linear p-V characteristic curve
- Functionality is independent of temperature influences

5.7. ACCUMULATOR STATIONS

HYDAC supplies fully assembled accumulator stations which are ready for operation, complete with all the necessary valve controls, pipe fittings and safety devices

- as an individual accumulator unit or
- in a back-up version with nitrogen bottles to increase the effective volume.

5.8. ACCUMULATOR ACCESSORIES

5.8.1 Hydraulic accumulators with back-up nitrogen bottles

HYDAC also offers nitrogen bottles which can be used to back up bladder and piston accumulators. Nitrogen bottles used as back-ups increase the gas volume in the accumulator.

Advantages of using HYDAC nitrogen bottles:

- Inexpensive increase of accumulator volume
- This leads to smaller accumulators with the same gas volume

5.8.2 FPU Charging and testing unit

Charging hose, pressure gauge and pressure reducer for HYDAC and other brands of accumulator, up to 800 bar pre-charge pressure – higher pressures on request.

Further products related to "charging and testing" are available in the nitrogen charging units (N2 servers) section – see catalogue section:

- Nitrogen charging units N2-Server No. 2.201

Portable, mobile and stationary versions are available.
We are always happy to give advice.

5.8.3 SAF/DSV Safety and shut-off block

Nominal size:
8 ... 50

Permitted operating pressure:
800 bar

Fluid-side protection, pressure relief valve, unloading to tank and separation of the accumulator from the fluid-side system.

Advantages of the HYDAC safety and shut-off block:

- Minimal space requirements and maintenance costs
- Minimal pipework required (as a rule, 1 SAF replaces up to 10 individual pipe connections)
- Considerable reduction in installation time
- Can be adapted to different types and different brands of accumulator
- Can be adapted to additional valves (pilot-operated check valves, flow control valves, etc.).

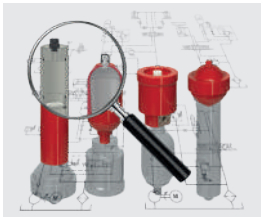
5.8.4 Safety devices

- GSV6 gas safety valve
- Temperature fuse
- Burst disc
- Gas safety block

All of the above are safety equipment for HYDAC accumulator products.

Advantages of the HYDAC gas safety block:

- A gas safety block simplifies the operation of the hydraulic accumulator on the gas side and also offers the possibility of installing the above safety equipment using the various ports.



5.8.5 Monitoring systems for hydraulic accumulators

- Bladder integrity system
- Piston position monitoring systems
- Pre-charge pressure monitoring

See also flyer:

- Monitoring systems for hydraulic accumulators No. 3.506

5.8.6 Mounting elements for hydraulic accumulators

Accumulator mounting sets, clamps and consoles for efficient installation of hydraulic accumulators.

Please make use of our online tool **Accu-MOUNT** to help you select the suitable mounting equipment for your hydraulic accumulator

www.hydac.com " Service " Online tools

5.8.7 ACCUSET SB

Permitted operating pressure:
330 bar

Nominal volume:
1 ... 50 l

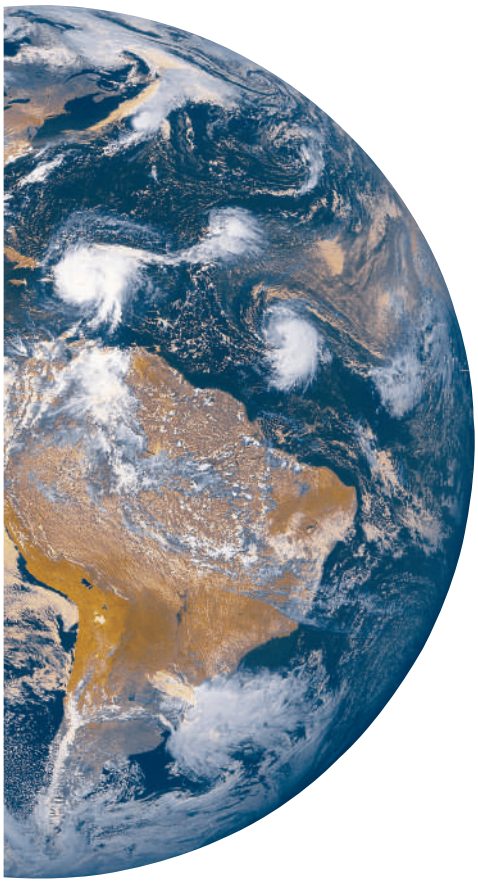
6. INDUSTRIES AND APPLICATIONS

HYDAC Technology GmbH is represented in almost all industries of the world which use hydraulic accumulators.

The main sectors are industrial hydraulics, mobile technology and process technology.

Further applications in the oil & gas/offshore industry and energy efficient applications involving hydraulic accumulators are gaining in importance.

The following list summarises the ways that accumulators/dampers are typically used in these industries:



6.1. STATIONARY HYDRAULICS

Automotive industry

- General industrial hydraulics, e.g. energy storage

Mining machinery

- Hydraulic accumulators, e.g. in suspended monorails
- Pulsation damping
- Comfort and safety for mobile working machines

Iron and steel industry

- Accumulator to maintain the pressure in rolling mills
- Blast furnace hydraulics

Plastics machinery

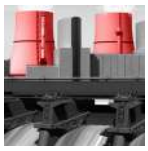
- Accumulator stations for energy storage during the injection moulding process
- Pulsation damping on the hydraulic drive

Paper industry

- Energy storage for emergency functions in friction bearing hydraulics
- Energy storage in high/low pressure power units

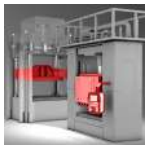
Test rigs and test systems

- Energy storage on crash test systems
- Pulsation damping on servo hydraulic axes



Thermal power plants

- Emergency supply for turbine control system
- Pulsation damping on pumps
- Lubrication, control and seal oil supply



Forming machines

- Hydraulic accumulators used to store energy to support the pump

Machine tools

- Support for the hydraulics for tool drive or tool change
- Energy storage in the compact hydraulics of machining centres

Wind turbines

- Hydraulic accumulators in the pitch control system
- Support of the pitch drive
- Accumulators on braking units

6.2. MOBILE TECHNOLOGY

Automotive technology

- Automatic and manual transmission
- Automatic clutch systems
- Engine management systems
- Accumulators for turbocharger emergency lubrication

Construction machines

- Accumulators in braking systems
- Chassis damping
- Bucket damping
- Boom damping on mobile cranes

Agricultural and forestry machines

- Front loader damping
- Accumulators in tractor suspension systems
- Stone strike protection for ploughs
- Boom suspension on field sprayers

Municipal machines

- Energy storage
- Boom damping
- Pulsation dampers
- Chassis damping

Lifting & material handling technology

- Noise damping
- Energy recovery
- Braking systems

Shipping

- Water treatment plants (pump support)
- Pulsation damping on diesel engines
- Heave compensation (cranes)
- Emergency function for lifeboats

6.3. PROCESS TECHNOLOGY

Chemical industry

- Energy storage and pulsation damping on dosing pumps
- Suction flow stabilisation on the suction side of pumps

Loading stations / refineries

- Shock absorption for valve closing
- Pulsation damping on piping

Offshore / Oil & Gas

- Accumulators to support valve closing systems
- Energy storage for deep sea rams
- Blow Out Preventers (BOP)
- Emergency function for safety systems
- Accumulators on wellhead control systems

Pipeline construction

- Energy storage for emergency actuation of valve stations
- Compressor stations

7. WEBSITE

Please visit us at the following address: www.hydac.com.

In addition to industries, services and fluid engineering, you will find the standard product range and the comprehensive range of HYDAC accessories at **Products » Hydraulic Accumulators**

Under Downloads you will find this product catalogue in different languages in PDF format as well as other information on HYDAC accumulator products (e.g. operating, installation and repair instructions).

You can find the required product via the product search tab and download the relevant CAD model.

Our online tool **ASP***light* facilitates quick and simple input, calculation and evaluation of the required accumulator parameters – see section 9.3.

Further tools, such as the **p_0-calculator** or **Accu-MOUNT**, can also be found at the same location.

8. SPECIFICATION FORM

Our aim is to provide optimal customer service both before and after the accumulator is purchased.

The following specification forms are designed to help pre-select the required accumulator/damper or accessories.

The specification forms are available in PDF format from the download section under **Products » Hydraulic Accumulators**.

The areas highlighted in green constitute the minimum information required for a response or calculation.

9. SIZING

9.1. DEFINITION OF VARIABLES FOR SIZING A HYDRAULIC ACCUMULATOR

Function	Limits for gas pre-charge pressure
Bladder accumulators  	p_0 ≤ 0.9 • p_1 with a permitted pressure ratio of $p_2 : p_0$ ≤ 4 : 1 For HYDAC low pressure accumulators, the following must also be taken into account: Type SB40: $p_{0\,max}$ = 20 bar Type SB35H: $p_{0\,max}$ = 10 bar
Piston accumulators  	$p_{0,tmin}$ ≥ 2 bar
Diaphragm accumulators  	a) Permitted pressure ratio: $p_2 : p_0$ Weld type: The pressure ratio of weld-type diaphragm accumulators is between 4 : 1 and 8 : 1, depending on the design – see catalogue section Diaphragm Accumulators, No. 3.100, section 3.1. Screw type: All sizes: 10 : 1 Other pressure ratios on request b) p_0 ≤ 0.9 • p_1
Metal bellows accumulators (e.g. corrugated bellow version)  	The max. permitted or optimal pre-charge pressure of a metal bellows accumulator (with corrugated or diaphragm bellows) must be determined for each application and each design version by providing information on the particular operating conditions and consulting with HYDAC.

The specified values are maximum values and must not be considered as referring to a prolonged load. The tolerable pressure ratio is influenced by the geometry, temperature, fluid, flow rate and gas losses caused by physical properties.

① The accumulator is pre-charged with nitrogen. The separating element (piston, bladder, diaphragm, metal bellows) shuts off the fluid port.

② Temperature effects must be taken into account when choosing the minimum operating pressure. The minimum operating pressure must also be higher than the gas pre-charge pressure ($p_1 > p_0$). This should prevent the separation element from striking the fluid port every time fluid is discharged.

③ Once the max. operating pressure is reached, the effective volume ΔV is available in the accumulator:

p_0 = pre-charge pressure
p_1 = minimum operating pressure
p_2 = maximum operating pressure
V_0 = effective gas volume
V_1 = gas volume at p_1
V_2 = gas volume at p_2
t_0 = pre-charge temperature
t_{min} = min. operating temperature
t_{max} = max. operating temperature

9.2. SELECTING THE PRE-CHARGE PRESSURE

The selection of the pre-charge pressure defines the accumulator capacity. In order to obtain optimum utilisation of the accumulator volume, the following pre-charge pressures are recommended:

9.2.1 Recommended values

For energy storage:

$p_{0,t\,max}$ = 0.9 • p_1

For shock absorption:

$p_{0,t\,max}$ = 0.6 to 0.9 • p_m

(p_m = average operating pressure for free flow)

For pulsation damping:

$p_{0,t\,max}$ = 0.6 • p_m

(p_m = average operating pressure)

or

$p_{0,t\,max}$ = 0.8 • p_1

(for several operating pressures)

During operation, the separating element (piston, bladder, diaphragm, corrugated bellows) must not touch the fluid-side connection.

Since the volume of the gas increases as the temperature increases, the pre-charge pressure must be determined at the maximum operating temperature using the recommended values.

9.2.2 Limits for gas pre-charge pressure

See section 9.1.

9.2.3 Temperature effect

So that the recommended pre-charge pressures can be maintained, even at relatively high operating temperatures, the $p_{0\,charge}$ for charging and testing cold accumulators must be selected as follows:

$$p_{0,\,t\,charge} = p_{0,t\,max} \cdot \frac{t_{charge} + 273}{t_{max} + 273}$$

$t_0 = t_{charge}$ (pre-charge temperature in °C)

To take the temperature influence into account when sizing accumulators, p_0 at t_0 must be selected as follows:

$$p_{0,\,t\,min} = p_{0,t\,max} \cdot \frac{t_{min} + 273}{t_{max} + 273}$$

9.3. ONLINE TOOLS

The following HYDAC online tools are available at:
www.hydac.com " Service " Online tools

9.3.1 ASP*light*

ASP*light* is an intelligent application which takes real gas behaviour into account It enables you to calculate all the necessary parameters such as pressure, volume and temperature in different units for gases such as nitrogen or helium. Additional information fields help to evaluate the result and determine the type of accumulator.

ASP*light* is aimed at users who need to determine the main accumulator parameters in a short space of time.

9.3.2 p_0-calculator

The **p_0-calculator** is a simple conversion tool for determining the pre-charge pressure (p_0) in the hydraulic accumulator at a specific temperature.

All that is needed is the reference pre-charge pressure and the current temperature of the hydraulic accumulator measured on the gas side.

The **p_0-calculator** takes the real gas behaviour into account. The online tool display is optimised for both smartphones and desktops and is available online around the clock.

The **p_0-calculator** offers reliability for the inspection and any required correction of the accumulator's pre-charge pressure outside of the reference temperature.

9.3.3 Accu-MOUNT

With the **Accu-MOUNT**, the suitable clamps, consoles and accumulator mounting sets can be identified on the basis of the accumulator designation, the part number or its characteristics. These accessories can then be added to the request list.

You can also find links to the corresponding product pages on our website and download 3D models, brochures and other information.

The **Accu-MOUNT** can find the perfect mounting equipment for HYDAC hydraulic accumulators in an instant.

10. NOTE

The information in this brochure relates to the operating conditions and fields of application described.

For applications and/or operating conditions not described, please contact the relevant technical department.

Subject to technical modifications.

Bladder Accumulators
Low pressure

1. DESCRIPTION

1.1. FUNCTION

Fluids are practically incompressible and cannot therefore store pressure energy.

The compressibility of a gas is utilised in hydraulic accumulators for storing fluids. HYDAC bladder accumulators are based on this principle, using nitrogen as the compressible medium.

A bladder accumulator consists of a fluid section and a gas section with the bladder acting as the gas-tight separation element. The fluid around the bladder is connected to the hydraulic circuit so that the bladder accumulator draws in fluid when the pressure increases and the gas is compressed. When the pressure drops, the compressed gas expands and forces the stored fluid into the circuit.

HYDAC bladder accumulators can be used in a wide variety of applications, some of which are listed below:

- Energy storage
- Emergency operation
- Force equilibrium
- Leakage compensation
- Volume compensation
- Shock absorption
- Vehicle suspension
- Pulsation damping

See catalogue section:

- Hydraulic dampers
  No. 3.701

1.2. DESIGN

HYDAC low pressure bladder accumulators consist of a welded pressure vessel, a flexible bladder with gas valve and a hydraulic connection with a perforated disc or check valve.

The table shows the different models which are described in greater detail in the pages that follow:

Designation	Perm. pressure [bar] [2]	Volume [l]	Q [1] [l/s]
SB40- 2.5 ... 50	40	2.5 - 50	7
SB40- 70 ... 220		70 - 220	30
SB35HB- 20 ... 50	35	20 - 50	20
SB16A- 150 ... 450	16	150 - 450	15
SB35A- 150 ... 450	35		
SB16AH- 150 ... 450	16		20
SB35AH- 150 ... 450	35		

[1] Q = max. flow rate of pressure fluid
[2] Higher pressures on request

1.3. BLADDER MATERIAL

The bladder material must be selected in accordance with the particular operating medium or operating temperature, see section 2.1.

If discharge conditions are unfavourable (high p_2/p_0 pressure ratio, rapid discharge speed), the gas may cool to below the permitted temperature.
This can cause cold cracking. The gas temperature can be calculated using the HYDAC Accumulator Simulation Program **ASP**.

1.4. CORROSION PROTECTION

For operation with chemically aggressive media, the accumulator shell can be supplied with corrosion protection, such as plastic coating on the inside or chemical nickel-plating. If this is insufficient, then stainless steel hydraulic accumulators must be used.

1.5. INSTALLATION POSITION

HYDAC bladder accumulators can be installed vertically, horizontally and at a slant. When installing vertically or at a slant, the fluid valve must be at the bottom. For certain applications listed below, particular positions are preferable:

- Energy storage:
  vertical
- Pulsation damping:
  any position from horizontal to vertical
- Maintaining constant pressure:
  any position from horizontal to vertical
- Pressure surge damping:
  vertical
- Volume compensation:
  vertical

If the installation position is horizontal or at a slant, the effective fluid volume and the maximum permitted flow rate of the operating fluid are reduced.

Bladder accumulators SB16A / SB35A and SB16AH / SB35AH must only be installed vertically with the gas side uppermost.

1.6. TYPE OF INSTALLATION

For strong vibrations and volumes above 1 litre, we recommend the use of HYDAC mounting clamps or the HYDAC accumulator mounting set.

See catalogue sections:

- Mounting elements for hydraulic accumulators
  No. 3.502
- ACCUSET SB
  No. 3.503

2. SPECIFICATIONS

2.1. EXPLANATIONS, NOTES

2.1.1 Operating pressure

See section 3. for the particular series (may differ from nominal pressure for foreign test certificates)

2.1.2 Permitted operating temperature of the hydraulic accumulator

-10 °C ... +80 °C
Standard design, others on request

2.1.3 Nominal volume

See section 3. for the particular series

2.1.4 Effective gas volume

See section 3. for the particular series, Based on nominal dimensions, this differs slightly from the nominal volume and must be used when calculating the effective fluid volume.

2.1.5 Effective volume

Volume of fluid which is available between the operating pressures p_2 and p_1.

2.1.6 Max. flow rate of the operating fluid

In order to achieve the max. flow rate given in the tables, the accumulator must be installed vertically. It must be noted that a residual fluid volume of approx. 10 % of the effective gas volume remains in the accumulator.
The maximum flow rate of the operating fluid was determined under specific typical conditions and is not applicable in all operating conditions.

2.1.7 Working temperature and operating medium

The permitted working temperature of a bladder accumulator is dependent on the application limits of the metal materials and the bladder. Outside this temperature range, special materials must be used. The operating medium must also be taken into account.

The following table displays a selection of elastomer materials including max. temperature range and a rough overview of resistant and non-resistant fluids. Please contact us for help in selecting a suitable elastomer.

Materials		Material code [1]	Temperature range	Overview of the fluids [2]	
				Resistant to	Not resistant to
NBR	Acrylonitrile butadiene rubber	2	-15 °C ... + 80 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the groups HFA, HFB, HFC ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Fuels
		5	-50 °C ... + 50 °C		
		9	-30 °C ... + 80 °C		
ECO	Ethylene oxide epichlorohydrin rubber	3	-30 °C ... +120 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the HFB group ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the groups HFA and HFC ● Fuels
IIR	Butyl rubber	4	-50 °C ... +100 °C	● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the group HFC ● Water	● Mineral oils and mineral greases ● Synthetic esters (HEES) ● Aliphatic, chlorinated and aromatic hydrocarbons ● Fuels
FKM	Fluorine rubber	6	-10 °C ... +150 °C	● Mineral oil (HL, HLP) ● Hydraulic fluids from the group HFD ● Synthetic esters (HEES) ● Fuels ● Aromatic hydrocarbons ● Inorganic acids	● Amines and ketones ● Ammonia ● Skydrol and HyJet IV ● Steam

[1] See section 2.2. Model code, material code, accumulator bladder

[2] Others on request

2.1.8 Gas charging

Hydraulic accumulators must only be charged with nitrogen.
Never use other gases.
Risk of explosion!

In principle, only use nitrogen of at least Class 4.0 (filtration < 3 µm).
If other gases are to be used, please contact HYDAC for advice.

2.1.9 Limits for gas pre-charge pressure

$p_0 \leq 0.9 \bullet p_1$
with a permitted pressure ratio of:
$p_2 : p_0 \leq 4 : 1$
p_2 = max. operating pressure
p_0 = pre-charge pressure

For HYDAC low pressure accumulators, the following must also be taken into account:

Type SB40:	$p_{0\,max}$ = 20 bar*
Type SB16/35A/AH:	$p_{0\,max}$ = 10 bar
Type SB35HB:	$p_{0\,max}$ = 10 bar

* in model with perforated disc

The specified values are maximum values and must not be considered as referring to a permanent load. The tolerable pressure ratio is influenced by the geometry, temperature, fluid and flow rate as well as any gas losses due to physical properties.

2.1.10 **Certificate codes**

[1] Registration required in the individual territories or provinces.
Others on request

2.1.11 **Notice**

All work on HYDAC bladder accumulators must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.
The operating instructions must be observed!
No. 3.201.BA

Assembly and repair instructions are available for work which may be carried out on the bladder accumulator after installation and commissioning, e.g. repair work.
No. 3.201.M

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

- HYDAC Accumulator Technology No. 3.000

2 = NBR [5]
3 = ECO
4 = IIR
5 = NBR [5]
6 = FKM
7 = other
9 = NBR [5]

Certification code
U = European Pressure Equipment Directive (PED)

Permitted operating pressure [bar]

Connection
Thread, codes for fluid port: A, C, E, G
A = thread to ISO228 (BSP)
B = thread to DIN13 or ISO965/1 (metric)
C = thread to ANSI B1.1 (UN..-2B seal SAE J 514)
D = thread to ANSI B1.20.1 (NPT)
S = special thread, to customer specification

Flange, codes for fluid port: F
A = EN 1092-1 welding neck flange
B = flange ASME B16.5
C = SAE flange 3000 psi
D = SAE flange 6000 psi
S = special flange, to customer specification

Required gas pre-charge pressure must be stated separately!

[1] When ordering a spare bladder, please state diameter of the smaller shell port
[2] Dependent on type and pressure rating
[3] Standard materials, all other materials on request
[4] Elastomer types not available for all bladder sizes.
[5] Observe temperature ranges, see section 2.1.

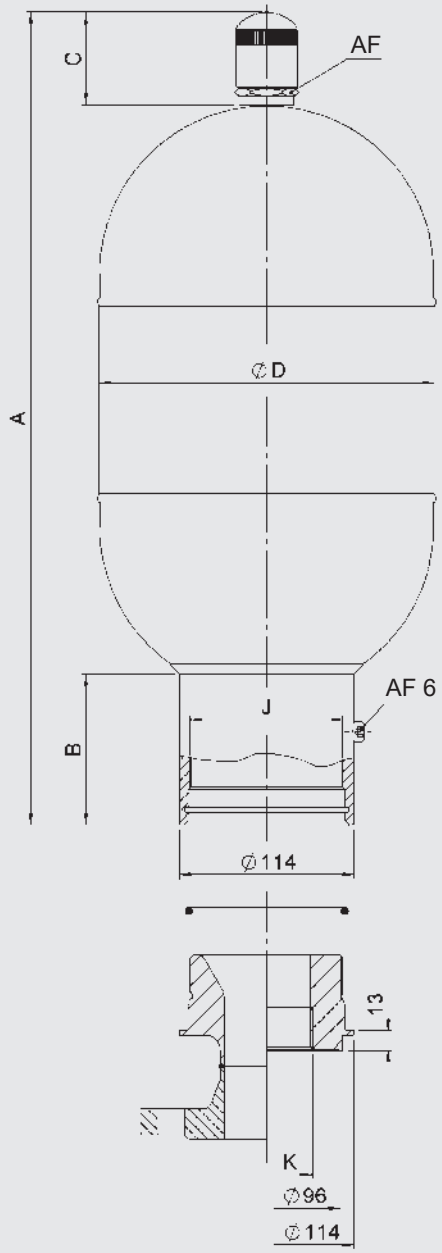
3. LOW PRESSURE ACCUMULATOR TYPES

3.1. SB40-2.5 ... 50

3.1.1 Design

HYDAC low pressure accumulators in the series SB40-2.5 ... 50 consist of a welded pressure vessel, an accumulator bladder with gas valve and a hydraulic connection with a perforated disc (check valve on request).
In addition, we can offer suitable adapters for connection to the hydraulic system.

3.1.2 Dimensions SB40-2.5 ... 50



Standard versions: permitted operating pressure 40 bar (PED)

3.3. SB16/35A AND SB16/35AH

3.3.1 **Design**

HYDAC low pressure bladder accumulators for large volumes have a welded design. The pressure vessel is fabricated in carbon steel or in stainless steel. The hydraulic outlet is covered by a perforated disc which prevents the flexible bladder from extruding from the shell. The bladder is top-removable.

3.3.2 **Dimensions**

SB16/35A **SB16/35AH**

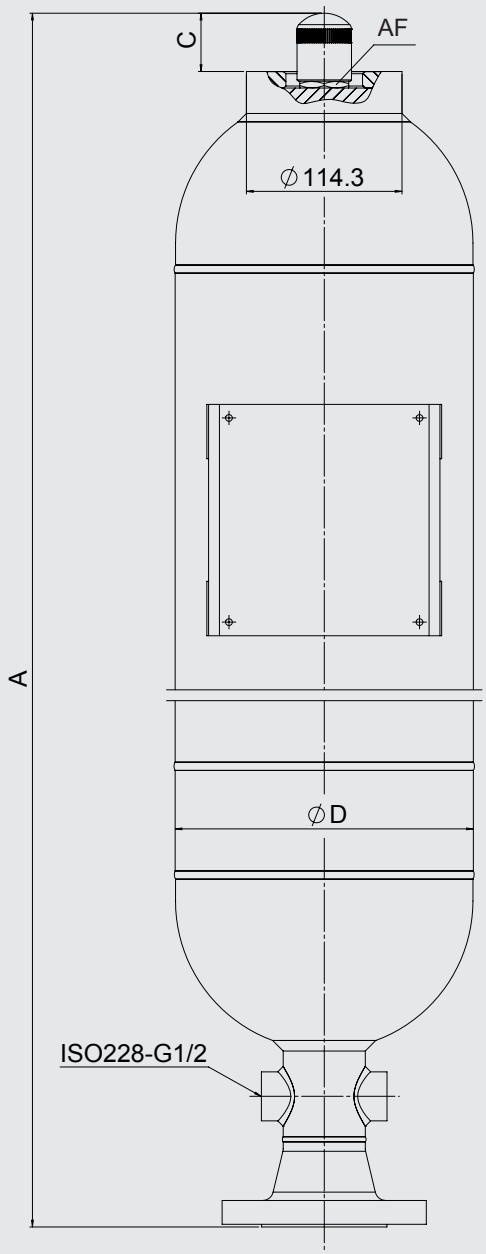
3.4. SB35HB

3.4.1 **Design**

HYDAC high flow bladder accumulators in the series SB35HB are high performance accumulators for flow rates of up to 20 l/s at 2 bar Δp. They consist of a welded pressure vessel and an accumulator bladder with gas valve. The pressure vessel contains a fixed perforated disc which permits a high flow rate through its large free cross section. In addition, we can offer suitable adapters for connection to the hydraulic system.

3.4.2 **Dimensions SB35HB**



Standard versions: permitted operating pressure 35 bar (PED)

Nominal volume [l]	Eff. gas volume [l]	Part no. Carbon steel, NBR	Part no. Stainless steel, NBR	A max. [mm]	C [mm]	Ø D [mm]	AF [mm]	Q [1] [l/s]	DN*	Weight [kg]

EN 3.202.7/04.21

Bladder Accumulators
Standard design

1. DESCRIPTION

1.1. FUNCTION

Fluids are practically incompressible and cannot therefore store pressure energy.

The compressibility of a gas is utilised in hydraulic accumulators for storing fluids. HYDAC bladder accumulators are based on this principle, using nitrogen as the compressible medium.

A bladder accumulator consists of a fluid section and a gas section with the bladder acting as the gas-tight separation element. The fluid around the bladder is connected to the hydraulic circuit so that the bladder accumulator draws in fluid when the pressure increases and the gas is compressed.
When the pressure drops, the compressed gas expands and forces the stored fluid into the circuit.

HYDAC bladder accumulators can be used in a wide variety of applications, some of which are listed below:

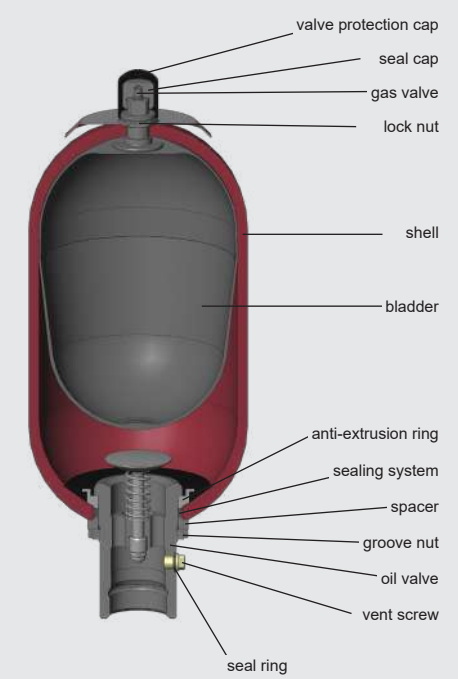
- Energy storage
- Emergency operation
- Force equilibrium
- Leakage compensation
- Volume compensation
- Shock absorption
- Vehicle suspension
- Pulsation damping

See catalogue section:

- Hydraulic dampers
  No. 3.701

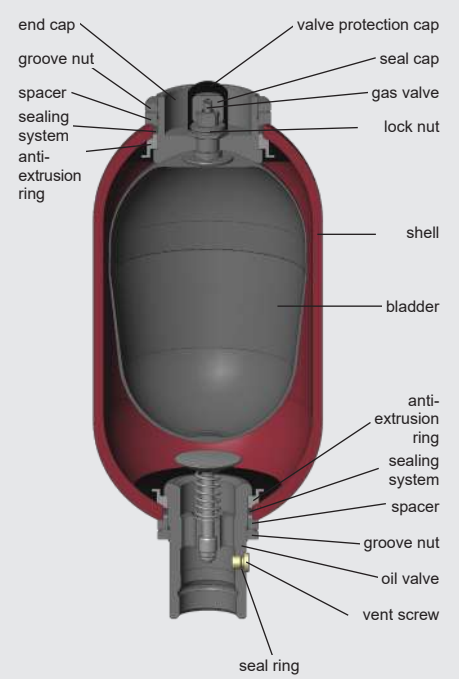
1.2. DESIGN

SB330/400/500/550/600, SB330H/SB330N



Design

- **Standard bladder accumulator SB330/400/500/550**
  HYDAC standard bladder accumulators consist of the pressure vessel, the flexible bladder with gas valve and the hydraulic connection with check valve. The pressure vessels are seamless and manufactured from high tensile steel.
- **Bladder accumulator SB330N**
  The flow-optimised design of the standard oil valve enables the maximum possible operating fluid flow rate to increase to 25 l/s with this accumulator type.
- **High flow bladder accumulator SB330H**
  HYDAC high flow bladder accumulators type SB330 are high performance accumulators with a flow rate of up to 30 l/s. The fluid port is enlarged to allow higher flow rates.
- **SB600**
  For higher pressures, with the ASME U stamp, HYDAC provides the series SB600 with approval S (p_{max} 345 bar / 5000 psi).



Design

- **Bladder accumulator SB330B**
  HYDAC bladder accumulators SB330B are designed to allow the bladder to be removed from above. This has the advantage that the bladder accumulator does not need to be removed from the hydraulic system for inspection and repair work.

1.3. BLADDER MATERIAL

The bladder material must be selected in accordance with the particular operating medium or operating temperature, see section 2.1.
If discharge conditions are unfavourable (high p_2/p_0 pressure ratio, rapid discharge speed), the gas may cool to below the permitted temperature. This can cause cold cracking. The gas temperature can be calculated using the HYDAC Accumulator Simulation Program **ASP**.

1.4. CORROSION PROTECTION

For operation with chemically aggressive media, the accumulator shell can be supplied with corrosion protection, such as chemical nickel-plating. If this is insufficient, then stainless steel hydraulic accumulators must be used.

1.5. INSTALLATION POSITION

HYDAC bladder accumulators can be installed vertically, horizontally and at a slant. When installing vertically or at a slant, the oil valve must be at the bottom. For certain applications listed below, particular positions are preferable:

- Energy storage: vertical
- Pulsation damping: any position from horizontal to vertical
- Maintaining constant pressure: any position from horizontal to vertical
- Volume compensation: vertical

If the installation position is horizontal or at a slant, the effective fluid volume and the maximum permitted flow rate of the operating fluid are reduced.

1.6. TYPE OF INSTALLATION

By using an adapter, HYDAC hydraulic accumulators with a volume of up to 1 l can be installed directly inline.

For strong vibrations and volumes above 1 litre, we recommend the use of HYDAC mounting clamps or the HYDAC accumulator mounting set.

See catalogue sections:

- Mounting elements for hydraulic accumulators
  No. 3.502
- ACCUSET SB
  No. 3.503

2. SPECIFICATIONS

2.1. EXPLANATIONS, NOTES

2.1.1 Operating pressure

See tables in section 3. (PED)
May differ from nominal pressure for other test certificates.

2.1.2 Permitted operating temperature of the hydraulic accumulator

-10 °C ... +80 °C
Standard design, others on request

2.1.3 Nominal volume

See tables in section 3.

2.1.4 Effective gas volume

See tables in section 3.
Based on nominal dimensions, this differs slightly from the nominal volume and must be used when calculating the effective fluid volume.

2.1.5 Effective volume

Volume of fluid which is available between the operating pressures p_2 and p_1.

2.1.6 Max. flow rate of the operating fluid

In order to achieve the max. flow rate given in the tables, the accumulator must be installed vertically. It must be noted that a residual fluid volume of approx. 10 % of the effective gas volume remains in the accumulator.
The maximum fluid flow rate was determined under specific conditions and is not applicable in all operating conditions.

2.1.7 Working temperature and operating medium

The permitted working temperature of a bladder accumulator is dependent on the application limits of the metal materials and the bladder. Outside this temperature range, special materials must be used. The operating medium must also be taken into account. The following table displays a selection of elastomer materials including max. temperature range and a rough overview of resistant and non-resistant fluids. Please contact us for help in selecting a suitable elastomer.

Materials		Material code [1]	Temperature range	Overview of the fluids [2]	
				Resistant to	Not resistant to
NBR	Acrylonitrile butadiene rubber	2	-15 °C ... + 80 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the groups HFA, HFB, HFC ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Fuels
		5	-50 °C ... + 50 °C		
		9	-30 °C ... + 80 °C		
ECO	Ethylene oxide epichlorohydrin rubber	3	-30 °C ... +120 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the HFB group ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the groups HFA and HFC ● Fuels
IIR	Butyl rubber	4	-50 °C ... +100 °C	● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the group HFC ● Water	● Mineral oils and mineral greases ● Synthetic esters (HEES) ● Aliphatic, chlorinated and aromatic hydrocarbons ● Fuels
FKM	Fluorine rubber	6	-10 °C ... +150 °C	● Mineral oil (HL, HLP) ● Hydraulic fluids from the group HFD ● Synthetic esters (HEES) ● Fuels ● Aromatic hydrocarbons ● Inorganic acids	● Amines and ketones ● Ammonia ● Skydrol and HyJet IV ● Steam

[1] See section 2.2. Model code, material code, accumulator bladder
[2] Others on request

2.1.8 Gas charging

Hydraulic accumulators must only be charged with nitrogen.
Never use other gases.
Risk of explosion!

In principle, only use nitrogen of at least Class 4.0 (filtration < 3 µm).
If other gases are to be used, please contact HYDAC for advice.

2.1.9 Limits for gas pre-charge pressure

$p_0 \leq 0.9 \bullet p_1$

with a permitted pressure ratio of:
$p_2 : p_0 \leq 4 : 1$

p_2 = max. operating pressure
p_0 = pre-charge pressure

The specified values are maximum values and must not be considered as referring to a permanent load. The tolerable pressure ratio is influenced by the geometry, temperature, fluid and flow rate as well as any gas losses due to physical properties.

2.1.10 Certificate codes

Country	Certificate code (CC)
EU member states	U
Australia	F [1)]

2.1.12 Notice

All work on HYDAC bladder accumulators must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.

The operating instructions must be observed!
No. 3.201.BA

Assembly and repair instructions are available for work which may be carried out on the bladder accumulator after installation and commissioning, e.g. repair work.
No. 3.201.M

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

- HYDAC Accumulator Technology
  No. 3.000

4. ACCESSORIES FOR BLADDER ACCUMULATORS

4.1. ADAPTERS (GAS SIDE)

The adapters shown below are available for standard connections on bladder accumulators and must be specified separately in the order.

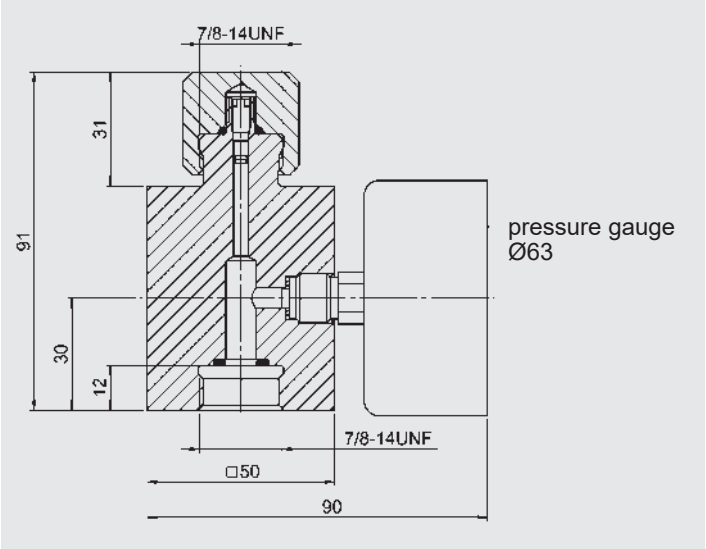
4.1.1 **Adapter for safety devices**

Adapter for connecting safety devices, such as burst discs or temperature fuses, see catalogue section:

- Safety equipment for hydraulic accumulators No. 3.552

4.1.2 **Pressure gauge model**

Gas-side connection on the bladder accumulator for permanent monitoring of the pre-charge pressure



Gauge indication range	Pressure gauge Part no.	Adapter* assembly Part no.

Bladder Accumulators
High pressure

1. DESCRIPTION

1.1. FUNCTION

Fluids are practically incompressible and cannot therefore store pressure energy.

The compressibility of a gas (nitrogen) is utilised in hydraulic accumulators for storing fluids.
HYDAC bladder accumulators are based on this principle.

A bladder accumulator consists of a fluid section and a gas section with the bladder acting as the gas-tight separation element.

The fluid around the bladder is connected to the hydraulic circuit so that the bladder accumulator draws in fluid when the pressure increases and the gas is compressed. When the pressure drops, the compressed gas expands and forces the stored fluid into the circuit.

HYDAC bladder accumulators can be used in a wide variety of applications and are also available in different pressure ranges, see catalogue sections:

- Bladder accumulators
  Standard design
  No. 3.201
- Bladder accumulators
  Low pressure
  No. 3.202
- HYDAC Accumulator Technology
  No. 3.000

1.2. DESIGN

The high pressure bladder accumulator consists of the pressure vessel, the flexible bladder with gas valve and the hydraulic connection with check valve.

1.2.1 **Shell material**

The pressure vessel is seamless and manufactured from high tensile chrome molybdenum steel.

1.2.2 **Bladder material**

The bladder material must be selected in accordance with the particular operating medium or operating temperature, see section 2.1.
If discharge conditions are unfavourable (high p_2/p_0 pressure ratio, rapid discharge speed), the gas may cool to below the permitted temperature. This can cause cold cracking. The gas temperature can be calculated using the HYDAC Accumulator Simulation Program **ASP**.

1.2.3 **Corrosion protection**

For operation with chemically aggressive media, the accumulator shell can be chemically nickel-plated internally or supplied with a special plastic coating.

For external corrosion protection, the hydraulic accumulator can be supplied with an epoxy resin finish specially designed for offshore applications.

1.3. INSTALLATION POSITION AND TYPE OF INSTALLATION

Information on secure installation positions and mounting elements can be found in the following catalogue sections:

- Bladder accumulators
  Standard design
  No. 3.201
- Mounting elements for hydraulic accumulators
  No. 3.502
- ACCUSET SB
  No. 3.503

2. SPECIFICATIONS

2.1. EXPLANATIONS, NOTES

2.1.1 **Operating pressure**

690 bar (10000 psi)
Higher pressures on request

2.1.2 **Permitted operating temperature of the hydraulic accumulator**

-10 °C ... +80 °C

Standard design, others on request

2.1.3 **Working temperature and operating medium**

The permitted working temperature of a bladder accumulator is dependent on the application limits of the metal materials and the bladder. Outside this temperature range, special materials must be used. The operating medium must also be taken into account.

The following table displays a selection of elastomer materials including max. temperature range and a rough overview of resistant and non-resistant fluids. Please contact us for help in selecting a suitable elastomer.

Materials		Material code [1]	Temperature range	Overview of the fluids [2]	
				Resistant to	Not resistant to
NBR	Acrylonitrile butadiene rubber	2	-15 °C ... + 80 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the groups HFA, HFB, HFC ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Fuels
		5	-50 °C ... + 50 °C		
		9	-30 °C ... + 80 °C		
ECO	Ethylene oxide epichlorohydrin rubber	3	-30 °C ... +120 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the HFB group ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the groups HFA and HFC ● Fuels
IIR	Butyl rubber	4	-50 °C ... +100 °C	● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the group HFC ● Water	● Mineral oils and mineral greases ● Synthetic esters (HEES) ● Aliphatic, chlorinated and aromatic hydrocarbons ● Fuels
FKM	Fluorine rubber	6	-10 °C ... +150 °C	● Mineral oil (HL, HLP) ● Hydraulic fluids from the group HFD ● Synthetic esters (HEES) ● Fuels ● Aromatic hydrocarbons ● Inorganic acids	● Amines and ketones ● Ammonia ● Skydrol and HyJet IV ● Steam

[1] See section 2.2. Model code, material code, accumulator bladder
[2] Others on request

2.1.4 **Gas charging**

Hydraulic accumulators must only be charged with nitrogen.
Never use other gases.
Risk of explosion!

In principle, only use nitrogen of at least Class 4.0 (filtration < 3 µm).
If other gases are to be used, please contact HYDAC for advice.

2.1.5 **Limits for gas pre-charge pressure**

$p_0 \leq 0.9 \cdot p_1$

with a permitted pressure ratio of:

$p_2 : p_0 \leq 4 : 1$

p_2 = max. operating pressure

p_0 = pre-charge pressure

The specified values are maximum values and must not be considered as referring to a permanent load. The tolerable pressure ratio is influenced by the geometry, temperature, fluid and flow rate as well as any gas losses due to physical properties.

2.1.6 **Notice**

All work on HYDAC bladder accumulators must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.

The operating instructions must be observed!
No. 3.201.BA

Assembly and repair instructions are available for work which may be carried out on the bladder accumulator after installation and commissioning, e.g. repair work.

No. 3.201.M

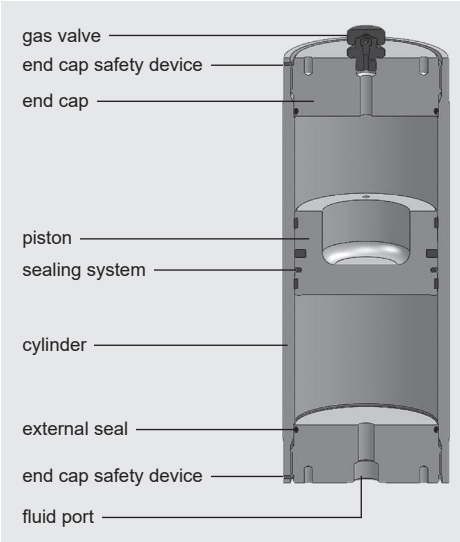
Piston Accumulators
Standard design

1. DESCRIPTION

1.1. FUNCTION

Fluids are practically incompressible and cannot therefore store pressure energy. The compressibility of a gas (nitrogen) is utilised in hydraulic accumulators for storing fluids. HYDAC piston accumulators are based on this principle.
A piston accumulator consists of a fluid section and a gas section with the piston acting as a gas-tight separation element. The gas section is pre-charged with nitrogen.
The fluid section is connected to the hydraulic circuit so that the piston accumulator draws in fluid when the pressure increases and the gas is compressed.
When the pressure drops, the compressed gas expands and forces the stored fluid into the circuit.

1.2. DESIGN



HYDAC piston accumulators consist of:

- A cylinder with very finely machined internal surface
- End caps on the gas side and the oil side, sealed with O-rings
- A floating steel or aluminium piston which can easily be accelerated due to its low weight
- A sealing system adapted to the particular field of application

The piston floats on guide rings which prevent metal-to-metal contact between the piston and the accumulator wall.
For use with certain aggressive or corrosive fluids, the parts coming into contact with the fluid can be nickel plated for protection, or made entirely from corrosion-resistant material.
Suitable materials are also available for low temperature applications.

When supplied piston accumulators are suitable for short-term storage.

Piston accumulators suitable for long-term storage are available on request.

1.3. SEALING SYSTEMS

Precise information about the intended operating conditions is required in order to select the most appropriate sealing system for the field of application. Important criteria for this selection are, for example, the:

- Design pressure
- Actual pressure differential
- Switching frequency or switching cycle
- Temperature fluctuation
- Operating fluid
- Cleanliness of fluid (filtration rating)
- Maintenance requirements

The sealing systems differ according to the type of piston used, each of which has its own type and arrangement of seals. Various elastomers are available as a sealing material, depending on the operating conditions, see section 1.7.5.

Design		Application	Contamination level of fluid	Comment
	1	● For general accumulator operation without special requirements Application limitations: max. piston velocity: 0.5 m/s	Optimised for applications with a high level of contamination	
	2	● Low-friction design ● For high piston speeds ● Depending on fluid, slow movements without stick-slip effect Application limitations: max. piston velocity: 3.5 m/s	Filtration: NAS 1638 – Class 6 ISO 4406 - Class 17/15/12	
	3	● Low-friction design ● Simple-to-fit seals ● Depending on fluid, slow movements without stick-slip effect Application limitations: max. piston velocity: 0.8 m/s		1 guide ring for pistons with Ø ≤ 150 mm 2 guide rings for pistons with Ø ≥ 180 mm
	4	● Low-friction design with emergency safety features ● Depending on fluid, slow movements without stick-slip effect ● Very low oil transfer to the gas side Application limitations: max. piston velocity: 5 m/s		

1.4. INSTALLATION POSITION

HYDAC piston accumulators operate in any position.
Vertical installation is preferable with the gas side at the top, to prevent contaminant particles from the fluid settling on the piston seals. For hydraulic accumulators with certain piston position indicators, vertical installation is essential.

1.5. TYPE OF INSTALLATION

For strong vibrations and volumes above 1 litre, we recommend the use of two HYDAC mounting clamps, or more as appropriate, ideally in the end cap area.
See catalogue section:

- Mounting elements for hydraulic accumulators No. 3.502

1.6. ADVANTAGES

- Complete range with nominal volumes up to over 3300 litres possible
- High ratios possible between pre-charge pressure and max. operating pressure
- Economic solution using back-up gas bottles for low pressure differentials
- High flow rates possible; limitation: max. piston velocity
- Power savings
- High level of efficiency of the hydraulic system
- No sudden gas discharge when seals are worn
- Low space requirements
- Monitoring of the volume across the entire piston stroke or electrical limit switch

Further advantages of using the low-friction sealing system:

- Minimum friction
- Also suitable for low pressure differentials
- No start-up friction
- Depending on fluid, slow movements without stick-slip effect
- Low noise, no vibration
- High piston velocity up to 5 m/s for piston design 4
- Improved accumulator efficiency
- Good service life of seals due to low wear
- Suitable for large temperature fluctuations
- Low maintenance requirements

1.7. TECHNICAL REQUIREMENTS

HYDAC piston accumulators are suitable for high flow rates (e.g. 1000 l/s).

1.7.1 **Effect of sealing friction**

The permitted piston velocity depends on the sealing friction.

Higher piston velocities are possible where there is less sealing friction.

HYDAC piston accumulators of piston design 2 allow velocities of up to 3.5 m/s.

1.7.2 **Permitted velocities**

Gas velocity
The flow velocities in the gas side connection and pipe system should be limited to 30 m/s when using piston accumulators of the back-up type. Gas velocities of over 50 m/s should be avoided at all costs.

Oil velocity
In order to limit the pressure losses when the operating fluid is displaced, the flow velocity should not exceed 10 m/s in the fitting cross-section.

1.7.3 **Function tests and fatigue tests**

Function tests and fatigue tests are carried out to ensure continuous improvement of our piston accumulators.
By subjecting the accumulators to endurance tests under realistic as well as extreme working conditions, important data can be obtained about the long-term behaviour of the components. In the case of piston accumulators, important information on gas density and the service life of seals is gained from such tests.

Vital data for use in accumulator sizing is gained by altering the working pressure and switching cycles.

1.7.4 **Gas charging**

Hydraulic accumulators must only be charged with nitrogen.
Never use other gases.
Risk of explosion!

In principle, only use nitrogen of at least Class 4.0 (filtration < 3 µm).
If other gases are to be used, please contact HYDAC for advice.

1.7.5 **Working temperature and operating medium**

The permitted working temperature of a piston accumulator is dependent on the application limits of the metal materials and the piston seal. Outside this temperature range, special materials must be used. The operating medium must also be taken into account.
The following table displays a selection of elastomer materials including max. temperature range and a rough overview of resistant and non-resistant fluids. Please contact us for help in selecting a suitable elastomer.

Materials		Material code [1]	Temperature range	Overview of the fluids [2]	
				Resistant to	Not resistant to
NBR	Acrylonitrile butadiene rubber	2	-20 °C ... + 80 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the groups HFA, HFB, HFC ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Fuels
		5	-40 °C ... + 80 °C		
PUR	Polyurethane	8	Standard application -30 °C ... + 80 °C Special application -40 °C ... +100 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the HFA group	● Water and water-glycol mixture HFC ● Alkalis ● Acids
FKM	Fluorine rubber	6	-15 °C ... +160 °C	● Mineral oil (HL, HLP) ● Hydraulic fluids from the group HFD ● Synthetic esters (HEES) ● Fuels ● Aromatic hydrocarbons ● Inorganic acids	● Amines and ketones ● Ammonia ● Skydrol and HyJet IV ● Steam

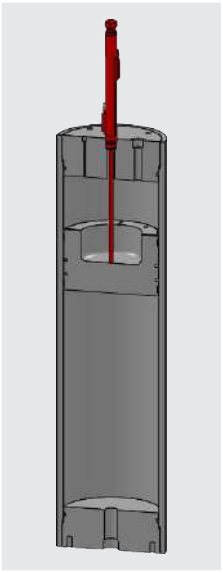
Examples of piston monitoring devices.
Further options for determining the piston position and detailed technical data available on request.

See also flyer:

- Monitoring systems for hydraulic accumulators
  No. 3.506

1.8.1 Electrical limit switch



What is measured?
Max. or set fill level of the piston accumulator

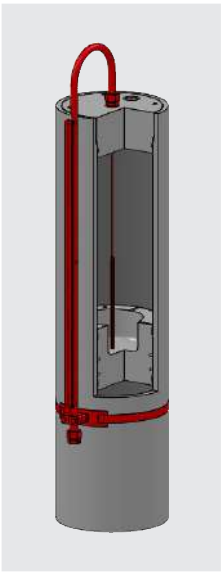
How are measurements taken?
As point measurements

Where to measure?
Gas side

Identification in the model code:
A, B, C, ..., depending on stroke

Product information:
No. 10000769094

1.8.2 Magnetic flap indication



What is measured?
Piston position via a magnet fastened to the cable that moves coloured flaps that can be read from the outside

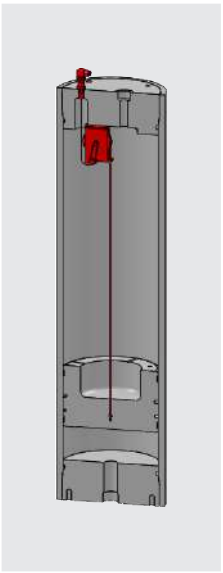
How are measurements taken?
Continuously

Where to measure?
Gas side

Identification in the model code:
M

Product information:
No. 10000769200

1.8.3 Cable tension measurement system



What is measured?
Piston position via a cable fastened to the piston

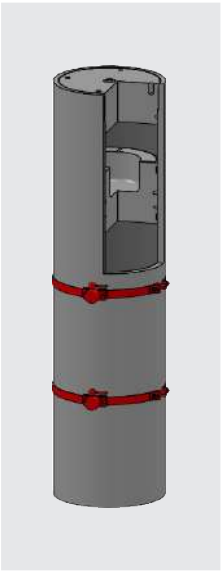
How are measurements taken?
Continuously

Where to measure?
Gas side

Identification in the model code:
S

Product information:
No. 10000641374

1.8.4 Piston position switch



What is measured?
Piston position via ultrasonic measurement

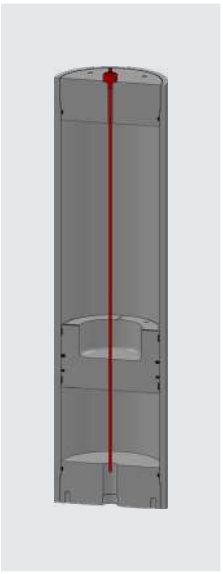
How are measurements taken?
As point measurements

Where to measure?
Fluid side

Identification in the model code:
UP...

Product information:
No. 10000769179

1.8.5 Linear position measurement system



What is measured?
Piston position via elapsed time measurement

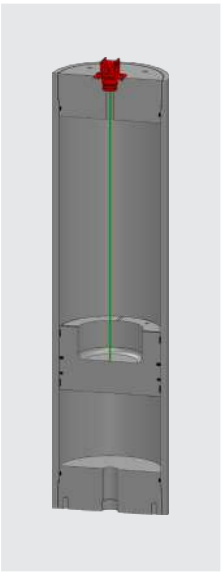
How are measurements taken?
Continuously

Where to measure?
Gas side

Identification in the model code:
L

Product information:
No. 10000810655

1.8.6 Laser linear position measurement system



What is measured?
Piston position via
laser elapsed time measurement

How are measurements taken?
Continuously

Where to measure?
Gas side

Identification in the model code:
LA

Product information:
No. 10000810664

Size of connection (see Tables 4 + 5)

Gas-side connection or gas valve
Type of connection (see Table 1)
Standard or specification of the type of connection (see Tables 2 + 3)
(no letter required with connection type V)
Size of connection (see Table 4; 5 + 6)

Piston diameter

04	= 40 mm	20	= 200 mm
05	= 50 mm	25	= 250 mm
06	= 60 mm	31	= 310 mm
08	= 80 mm	35	= 355 mm
10	= 100 mm	49	= 490 mm
12	= 125 mm	54	= 540 mm
15	= 150 mm	61	= 610 mm
18	= 180 mm		

Additional equipment*
Detailed technical data on request
A = electrical limit switch – 35 mm stroke
B = electrical limit switch – 200 mm stroke
C = electrical limit switch – 500 mm stroke
E.. = other electrical limit switch, fixed or adjustable
K = protruding piston rod
L = linear position measurement system
LA = laser linear position measurement system
M = magnetic flap indication
S = cable tension measurement system
U = ultrasonic measurement system
UP.. = piston position switch
(e.g. UP2 = 2 position switches, UPEX = ATEX version)
W = limit switch with linear position measurement system

Safety equipment*
1 = burst disc (please give nominal pressure and temperature)
2 = gas safety valve
3 = temperature fuse

Pre-charge pressure p_0 [bar] at 20 °C*

* If required, please state at time of ordering!
[1] Dependent on type and pressure rating
[2] Observe temperature ranges, see section 1.7.

Table 1, Connection type

Code letter	Description
A	Threaded connection (internal thread)
B	Threaded connection (external thread)
F	Flange connection
H	Protruding flange
K, S	Combination connection / special connection
V	Gas valve type

Table 2, Threaded connection: standard or specification

Code letter	Description
A	Thread to ISO 228 (BSP)
B	Thread to DIN 13 or ISO 965/1 (metric)
C	Thread to ANSI B1.1 (UN..-2B, seal SAE J 514)
D	Thread to ANSI B1.20.3 (NPTF)

Table 3, Flange connection: standard or specification

Code letter	Description
A	Flanges to DIN standards (pressure rating + standard)
B	Flanges to ANSI B 16.5
C	SAE flange 3000 psi
D	SAE flange 6000 psi
E	High pressure block flange (Bosch-Rexroth) PN320
F	High pressure block flange (AVIT, HAVIT) PN320

[1] Preferred models, others on request

[2] Material and piston code (MC) = 2112, see Model code, section 2.2.

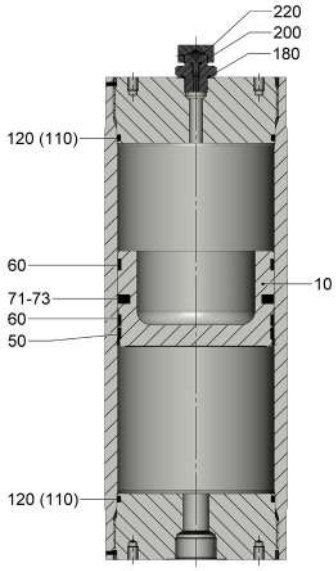
Notice:

Dimensions, particularly lengths, are approximate and dependent on various factors (e.g. piston design, approval).

The specified values are maximum values and must not be considered as referring to a permanent load. The tolerable pressure ratio is influenced by the geometry, temperature, fluid and flow rate as well as any gas losses caused by physical properties.

4. SPARE PARTS

Piston design 1



Description	Qty.	Item
Piston assembly [2] consisting of:		
Piston	1	10
Seal ring	1	50
Guide ring	2	60
Centre seal	1	71-73
Seal kit consisting of:		
Seal ring	1	50
Guide ring	2	60

Piston Accumulators
Series SK280

1. DESCRIPTION

1.1. FUNCTION

Fluids are practically incompressible and cannot therefore store pressure energy.

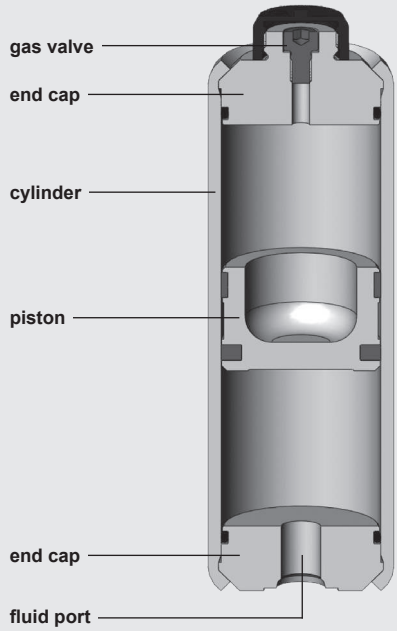
The compressibility of a gas (nitrogen) is utilised in hydraulic accumulators for storing fluids. HYDAC piston accumulators are based on this principle.

A piston accumulator consists of a fluid section and a gas section with the piston acting as a gas-tight separation element. The gas section is pre-charged with nitrogen.

The fluid section is connected to the hydraulic circuit so that the piston accumulator draws in fluid when the pressure increases and the gas is compressed.

When the pressure drops, the compressed gas expands and forces the stored fluid into the circuit.

1.2. DESIGN



HYDAC piston accumulators consist of:

- A cylinder with very finely machined internal surface
- End caps on the gas side and the oil side, sealed with O-rings
- A floating steel or aluminium piston
- A sealing system adapted to the particular application

The piston floats on guide rings which prevent metal-to-metal contact between the piston and the accumulator wall. Suitable materials are also available for low temperature applications.

1.3. ADVANTAGES

- Optimised production process, saving on material and manufacturing costs
- Reduced-weight series
- Reduced installation space
- Standard gas valve M28x1.5 integrated into end cap (non-rechargeable version possible)
- Endurance-tested (function and fatigue tests)

1.4. TYPE OF INSTALLATION

HYDAC can provide suitable accumulator clamps for the piston accumulator series SK280. The table in section 3 lists the appropriate clamps for each individual diameter. In order to prevent deformation of the cylinder, we recommend that the accumulators are mounted using two clamps, one at each end cap.

1.5. DESIGN PRESSURE

- Standard 280 bar
- Manufactured and inspected in accordance with European Pressure Equipment Directive (PED)

Higher pressures on request

The specified values are maximum values and must not be considered as referring to a permanent load. The tolerable pressure ratio is influenced by the geometry, temperature, fluid and flow rate as well as any gas losses caused by physical properties.

1.6. SEALING SYSTEM

- Piston design 3: NBR/PUR
- Standard temperature range: -20 °C ... + 80 °C
  Extended temperature range: -40 °C ... +100 °C

For further information, please turn to the section:

- Piston accumulators
  Standard design
  No. 3.301

1.7. NOTICE

All work on HYDAC piston accumulators must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.

The operating instructions must be observed!
No. 3.301.BA

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

- HYDAC Accumulator Technology
  No. 3.000

Piston Accumulators
High pressure

1. DESCRIPTION

1.1. FUNCTION

Fluids are practically incompressible and cannot therefore store pressure energy.

The compressibility of a gas is utilised in hydraulic accumulators for storing fluids.

HYDAC piston accumulators are based on this principle, using nitrogen as the compressible medium.

A piston accumulator consists of a fluid section and a gas section with the piston acting as a gas-tight separation element. The gas section is pre-charged with nitrogen.
The fluid section is connected to the hydraulic circuit so that the piston accumulator draws in fluid when the pressure increases and the gas is compressed. When the pressure drops, the compressed gas expands and forces the stored fluid into the circuit.

HYDAC piston accumulators can be used in a wide variety of applications and are also available in different pressure ranges, see also catalogue sections:

- Piston accumulators
  Standard design
  No. 3.301
- Piston accumulators
  Series SK280
  No. 3.303

1.2. DESIGN

The high pressure piston accumulator consists of:

- A cylinder with very finely machined internal surface
- End caps on the gas side and the oil side
- O-ring seals
- Floating metal piston
- High pressure sealing system

The piston floats on guide rings which prevent metal-to-metal contact between the piston and the accumulator wall. For use with certain aggressive or corrosive fluids, the parts coming into contact with the fluid can be nickel plated for protection or made entirely from corrosion-resistant material. Suitable materials are also available for low temperature applications.

When supplied piston accumulators are suitable for short-term storage. Accumulators suitable for long-term storage are available on request.

1.3. SEALING SYSTEMS

Precise information about the intended operating conditions is required in order to select the most appropriate sealing system for the field of application. Important criteria for this selection are, for example, the:

- Design pressure
- Actual pressure differential
- Switching frequency or switching cycle
- Piston velocity
- Operating temperature
- Operating fluid
- Cleanliness of fluid (filtration rating)
- Maintenance requirements

For high-pressure piston accumulators, an advanced piston design 2 is used which has been modified for applications up to 1000 bar.
Hydraulic accumulators must only be operated with pressure fluids with a minimum cleanliness class of:

- NAS 1638 Class 6 or
- ISO 4406 Class 17/15/12

1.4. INSTALLATION POSITION AND TYPE OF INSTALLATION

HYDAC piston accumulators operate in any position. Vertical installation is preferable with the gas side at the top, to prevent contaminant particles from the fluid settling on the piston seals.

Information on secure installation and mounting elements can be found in the following catalogue sections:

- Piston accumulators
  Standard design
  No. 3.301
- Mounting elements for hydraulic accumulators
  No. 3.502

2. SPECIFICATIONS

2.1. EXPLANATIONS, NOTES

2.1.1 **Operating pressure**

690 bar / 800 bar / 1000 bar
Others on request

2.1.2 **Permitted operating temperature of the hydraulic accumulator**

-20 °C ... +50 °C
Standard design, others on request

2.1.3 **Working temperature and operating medium**

The permitted working temperature of a piston accumulator is dependent on the application limits of the metal materials and the piston seal. Outside this temperature range, special materials must be used. The operating medium must also be taken into account.

The following table displays a selection of elastomer materials including max. temperature range and a rough overview of resistant and non-resistant fluids. Please contact us for help in selecting a suitable elastomer.

Materials		Material code [1]	Temperature range	Overview of the fluids [2]	
				Resistant to	Not resistant to
NBR	Acrylonitrile butadiene rubber	2	-20 °C ... + 80 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the groups HFA, HFB, HFC ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Fuels
		5	-40 °C ... + 80 °C		
FKM	Fluorine rubber	6	-15 °C ... +160 °C	● Mineral oil (HL, HLP) ● Hydraulic fluids from the group HFD ● Synthetic esters (HEES) ● Fuels ● Aromatic hydrocarbons ● Inorganic acids	● Amines and ketones ● Ammonia ● Skydrol and HyJet IV ● Steam

[1] See section 2.2. Model code, material and piston code, material of seals including piston seals
[2] Others available on request

2.1.4 **Gas charging**

Hydraulic accumulators must only be charged with nitrogen.
Never use other gases.
Risk of explosion!

In principle, only use nitrogen of at least Class 4.0 (filtration < 3 µm).
If other gases are to be used, please contact HYDAC for advice.

2.1.5 **Notice**

All work on HYDAC piston accumulators must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.

The operating instructions must be observed!
No. 3.301.BA

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

● HYDAC Accumulator Technology No. 3.000

Diaphragm Accumulators

1. DESCRIPTION

1.1. FUNCTION

Fluids are practically incompressible and cannot therefore store pressure energy.

The compressibility of a gas is utilised in hydraulic accumulators for storing fluids.

HYDAC diaphragm accumulators are based on this principle, using nitrogen as the compressible medium.

Diaphragm accumulators consist of a fluid section and a gas section with the diaphragm acting as a gas-tight separation element.

The fluid section is connected to the hydraulic circuit so that the diaphragm accumulator draws in fluid when the pressure increases and the gas is compressed. When the pressure drops, the compressed gas expands and forces the stored fluid into the circuit.

Set into the base of the diaphragm is a valve plate. This shuts off the hydraulic outlet when the accumulator is completely empty and thus prevents damage to the diaphragm.

Notice:
HYDAC diaphragm accumulators when fitted with a HYDAC safety and shut-off block comply with the regulations of the European Pressure Equipment Directive (PED) and the German Industrial Safety Regulations (Betr.Sich.V.).

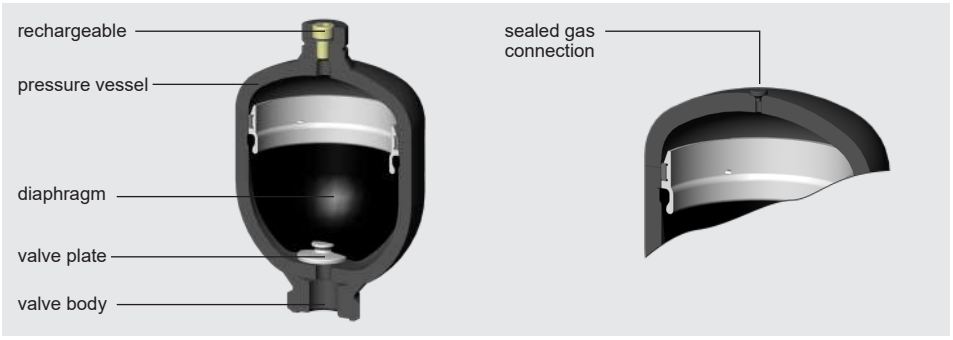
See catalogue section:

- Safety and shut-off block SAF/DSV No. 3.551

1.2. DESIGN

HYDAC diaphragm accumulators are available in two versions.

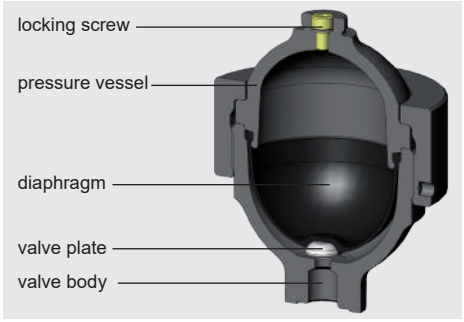
1.2.1 **Weld type**



This consists of:

- Welded pressure vessel, rechargeable on the gas side or, alternatively, completely sealed. Fluid port available in various types.
- Diaphragm to separate the fluid and gas sections.
- Valve plate set into the base of the diaphragm.

1.2.2 **Screw type**



This consists of:

- Forged upper section with gas charging connection.
- Forged lower section with fluid port.
- Exchangeable flexible diaphragm to separate the gas and fluid.
- Vulcanised valve plate set into the base of the diaphragm.
- Lock nut to hold the upper and lower sections of the accumulator together.

1.2.3 **Diaphragm material**

The diaphragm material must be selected in accordance with the particular operating medium or operating temperature, see section 2.1.
If discharge conditions are unfavourable (high p_2/p_0 pressure ratio, rapid discharge speed), the gas may cool to below the permitted temperature. This can cause cold cracking. The gas temperature can be calculated using the HYDAC Accumulator Simulation Program **ASP**.

1.2.4 **Corrosion protection**

For use with chemically aggressive fluids the hydraulic accumulator can be supplied with corrosion protection, such as plastic coating or a galvanic or chemical surface protection. If this is insufficient, then almost all types can be supplied in stainless steel.

1.3. INSTALLATION POSITION

Any position can be chosen. However, if there is a risk of contamination collecting, a vertical position is preferable (fluid port at the bottom).

1.4. TYPE OF INSTALLATION

Hydraulic accumulators up to a nominal volume of 2 l can be screwed directly inline.

Where strong vibrations are expected, the hydraulic accumulator must be secured to prevent it working loose. For weld type hydraulic accumulators we recommend HYDAC mounting clamps. For screw type diaphragm accumulators with a lock nut, a suitable support console can be ordered.

For an additional male thread on the hydraulic connection for screwing into mounting holes, see Table 3.1

See catalogue section:

- Mounting elements for hydraulic accumulators
  No. 3.502

2. SPECIFICATIONS

2.1. EXPLANATIONS, NOTES

2.1.1 **Permitted operating pressure**
See Tables 3.1. and 3.2.

The permitted operating pressure can differ from the nominal pressure for foreign test certificates.

2.1.2 **Permitted operating temperature of the hydraulic accumulator**
-10 °C ... +80 °C

Standard design, others on request

2.1.3 **Nominal volume**
See Tables 3.1. and 3.2.

2.1.4 **Effective gas volume**
Corresponds to the nominal volume of the diaphragm accumulator.

2.1.5 **Effective volume**
Volume of fluid which is available between the operating pressures p_2 and p_1.

2.1.6 **Gas charging**
All accumulators are supplied with a protective pre-charge.
Higher gas pre-charge pressures are available on request (gas charging screw or sealed gas connection).

Hydraulic accumulators must only be charged with nitrogen.
Never use other gases.
Risk of explosion!

In principle, only use nitrogen of at least Class 4.0 (filtration < 3 µm).

If other gases are to be used, please contact HYDAC for advice.

2.1.7 **Limits for gas pre-charge pressure**
$p_0 \leq 0.9 \bullet p_1$

For diaphragm accumulators with PTFE diaphragms, the following applies:
$p_{0tmax} \leq 200$ bar

For further information, see catalogue section:

- HYDAC Accumulator Technology
  No. 3.000

2.1.8 **Permitted pressure ratio**
See Tables 3.1. and 3.2.

Ratio of max. operating pressure p_2 to gas pre-charge pressure p_0.

The specified values are maximum values and must not be considered as referring to a permanent load. The tolerable pressure ratio is influenced by the geometry, temperature, fluid and flow rate as well as any gas losses due to physical properties.

2.1.9 **Max. flow rate of the operating fluid**
In order to achieve the max. flow rate given in the tables, a residual fluid volume of approx. 10 % of the effective gas volume must remain in the accumulator.

The maximum fluid flow rate was determined under specific typical conditions and is not applicable in all operating conditions.

2.1.10 **Working temperature and operating medium**
The permitted working temperature of a diaphragm accumulator is dependent on the application limits of the metal materials and the diaphragm. Outside this temperature range, special materials must be used. The operating medium must also be taken into account.

The following table displays a selection of elastomer materials including max. temperature range and a rough overview of resistant and non-resistant fluids. Please contact us for help in selecting a suitable elastomer.

Materials		Material code [1]	Temperature range	Overview of the fluids [2]	
				Resistant to	Not resistant to
NBR	Acrylonitrile butadiene rubber	2	-15 °C ... + 80 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the groups HFA, HFB, HFC ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Fuels
		5	-50 °C ... + 50 °C		
ECO	Ethylene oxide epichlorohydrin rubber	3	-40 °C ... +120 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the group HFB ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the groups HFA and HFC ● Fuels
IIR	Butyl rubber	4	-50 °C ... +120 °C	● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the group HFC ● Water	● Mineral oils and mineral greases ● Synthetic esters (HEES) ● Aliphatic, chlorinated and aromatic hydrocarbons ● Fuels
FKM	Fluorine rubber	6	-10 °C ... +150 °C	● Mineral oil (HL, HLP) ● Hydraulic fluids from the group HFD ● Synthetic esters (HEES) ● Fuels ● Aromatic hydrocarbons ● Inorganic acids	● Amines and ketones ● Ammonia ● Skydrol and HyJet IV ● Steam

[1] See section 2.2. Model code, material code, diaphragm
[2] Others available on request

2.1.11 **Certificate codes**

Hydraulic accumulators which are installed in countries outside Germany are supplied with the test certificates required in that country. The user country must be stated at the time of ordering.
HYDAC pressure vessels can be supplied with virtually any test certificate.
Please note that the permitted operating pressure can differ from the nominal pressure.
The following table contains a few examples of the codes used in the model code for different countries of installation:

Country	Certificate code (CC)
EU member states	U
Australia	F [1]
Belarus	A6
Canada	S1[1]
China	A9
Hong Kong	A9
Iceland	U
Japan	P
Korea (Republic)	A11
New Zealand	T

Metal bellows accumulators

1. DESCRIPTION

1.1. FUNCTION

Fluids are practically incompressible and cannot therefore store pressure energy.

The compressibility of a gas is utilised in hydraulic accumulators for storing fluids. HYDAC metal bellows accumulators are based on this principle, using nitrogen as the compressible medium.

They consist of a fluid section and a gas section with metal bellows acting as a gas-tight separation element.

The fluid section is connected to the hydraulic circuit so that the metal bellows accumulator draws in fluid when the pressure increases and the gas is compressed. When the pressure drops, the compressed gas expands and forces the stored fluid into the circuit.

1.2. ADVANTAGES

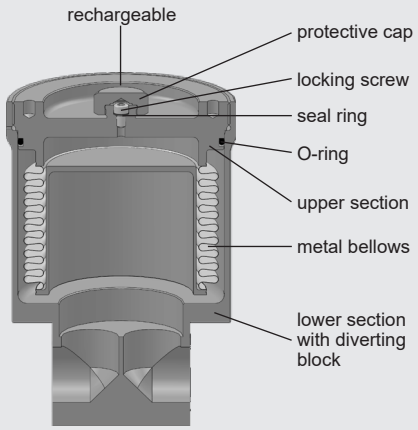
The special features of the metal bellows accumulator are:

- No frictional parts, low-maintenance, long service life
- Media-resistant in temperature ranges of -65 °C to over +160 °C
- Gas-tight

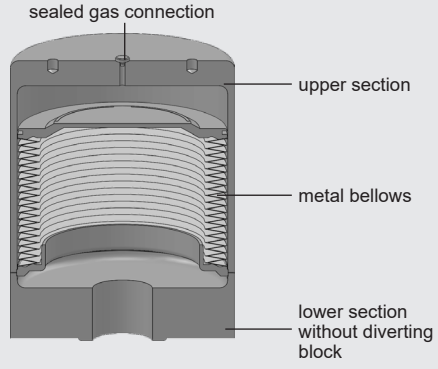
1.3. DESIGN

The design of the HYDAC metal bellows accumulator can vary considerably depending on the customer requirements or field of application.

Example design of a **metal bellows accumulator with corrugated bellows**



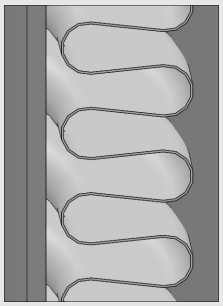
Example design of a **metal bellows accumulator with diaphragm bellows**



1.3.1 **Bellows design**

HYDAC supplies two types of bellows. The formed corrugated bellows and the welded diaphragm bellows.

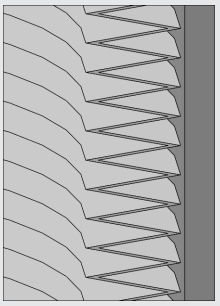
Corrugated bellows (formed)



Properties:

- Suitable for high differential pressures
- Unsusceptible to contamination
- Robust

Diaphragm bellows (welded)



Properties:

- High displacement volumes
- Very good energy saving properties
- Compact design

1.3.2 **Pressure vessel design**

The pressure vessel of the metal bellows accumulator fundamentally comprises of an upper section and a lower section. These can be connected in a wide variety of ways.

The most common variants are listed below, others are available on request.

Screw type

Weld type

Formed type

1.4. MATERIALS

The selection of materials for the pressure vessel, metal bellows and sealing systems must be coordinated to suit the particular operating medium, operating temperature and pre-charge pressure.

Pressure vessel: carbon steel, stainless steel

Metal bellows: stainless steel

Sealing system: NBR, FKM, etc.

See material code or on request.

1.5. CORROSION PROTECTION

The pressure vessel is fabricated in carbon steel or in stainless steel.

Various coating systems are available to protect carbon steel versions.

1.6. INSTALLATION POSITION

Metal bellows accumulators are preferably to be installed vertically, with the gas charging connection at the top. Other installation positions must be agreed with HYDAC.

1.7. TYPE OF INSTALLATION

HYDAC mounting elements must be used to securely fasten metal bellows accumulators.

1.8. CLEANLINESS

Diaphragm bellows accumulators must only be operated with hydraulic fluids that contain no hard particles and that have a minimum cleanliness class of:

- NAS 1638 Class 6 or
- ISO 4406 Class 17/15/12

Furthermore, the fluid must not solidify at any time.

2. SPECIFICATIONS

2.1. EXPLANATIONS, NOTES

2.1.1 **Explanatory notes**

HYDAC metal bellows accumulators are made with tailor-made designs and material selections. Because of their special properties, they are an outstanding addition to the HYDAC hydraulic accumulator product range. We are always happy to provide detailed advice.

2.1.2 **Notice**

All work on HYDAC metal bellows accumulators must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.

The operating instructions and the product-specific documents must be observed!
No. 3.304.BA

Detailed assembly and repair instructions are available for work which may be carried out on the metal bellows accumulator after installation and commissioning, e.g. repair work.
No. 3.304.M

Further information such as accumulator dimensioning, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

- HYDAC Accumulator Technology No. 3.000

Relevant PDF documents can be accessed at:
www.hydac.com » Downloads » Documents » Accumulator Division

2.2. MODEL CODE

Not all combinations are possible.
Order example. For further information, please contact HYDAC.

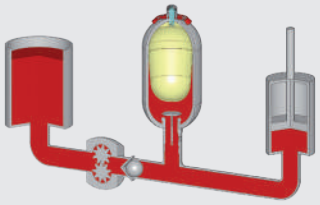
3. FUNCTION AND APPLICATION EXAMPLES

3.1. ENERGY STORAGE

The stored hydraulic energy is available from the accumulator for the following purposes: reserve pump capacity (emergency function, pump support) and leakage compensation.



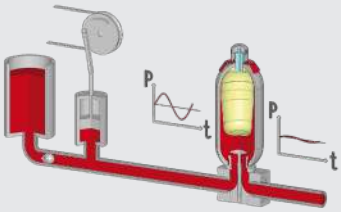
Application examples in the aviation industry

Application:
Supporting the working hydraulics for flight control

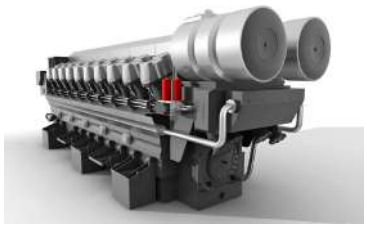
Accumulator type:
SM209
Nominal volume:
Up to 0.4 litres
Material:
Stainless steel
Version:
Diaphragm bellows

3.2. PULSATION DAMPING

Pressure pulsations are smoothed by the compressible gas inside the accumulator, e.g. suction flow stabilisation, reduction in noise level and vibrations.



Application examples in large diesel engines



Application:
Pulsation damping
Fuel system
Large diesel engines

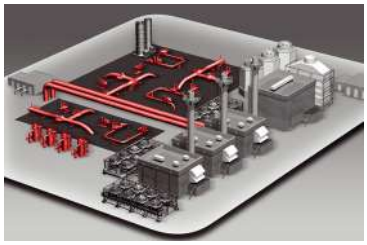
Accumulator type:
SM50P and SM50
Nominal volume:
3.8 and 1.6 litres
Material:
Carbon steel, coated
Version:
Corrugated bellows

Application examples in the aviation industry

Application:
Suction flow stabiliser
Hydraulic line
Engine supply

Accumulator type:
SM16
Nominal volume:
1 litre
Material:
Stainless steel
Version:
Diaphragm bellows
Special feature:
Visual condition check

Application examples in the chemical industry/process technology

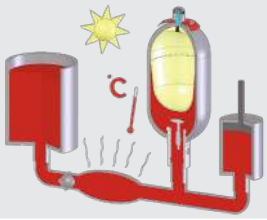


Application:
Suction flow stabiliser
3-piston pump

Accumulator type:
SM210
Nominal volume:
2 litres
Material:
Stainless steel
Version:
Diaphragm bellows
Special feature:
Flange connection

3.3. VOLUME COMPENSATION

The hydraulic accumulator compensates for surplus volume, for instance when the volume of the fluid increases due to an increase in temperature.



Application examples in the chemical industry/process technology

Application:
Volume compensation when temperature fluctuates

Accumulator type:
SM16
Nominal volume:
1 litre
Material:
Stainless steel
Version:
Diaphragm bellows

Accumulator type:
SM16
Nominal volume:
9.4 litres
Material:
Stainless steel
Version:
Diaphragm bellows
Special feature:
- High displacement volume
- Compact bellows design

4. NOTE

The information in this brochure relates to the operating conditions and fields of application described.
For applications and/or operating conditions not described, please contact the relevant technical department.
Subject to technical modifications.

EN 3.304.6/04.21

Hydraulic dampers

1. DESCRIPTION

1.1. FUNCTION

The pressure fluctuations occurring in hydraulic systems can be cyclical or one-off problems due to:

- Flow rate fluctuations from displacement pumps
- Actuation of shut-off and control valves with short opening and closing times
- Switching on and off of pumps
- Sudden linking of spaces with different pressure levels

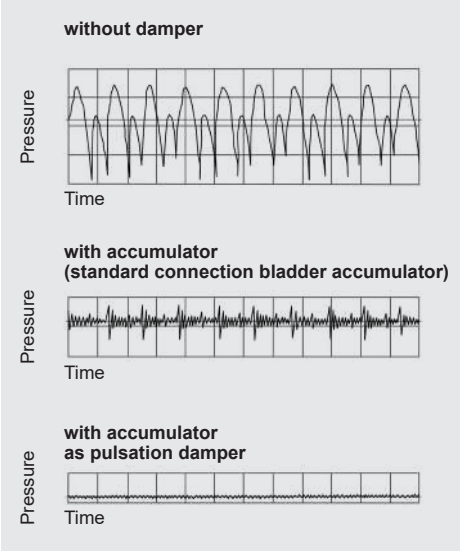
HYDAC hydraulic dampers are particularly suitable for damping such pressure fluctuations.

Selecting the most suitable hydraulic damper for each system ensures that:

- Vibrations caused by pipes, valves, couplings etc. are minimised and subsequent pipe and valve damage is prevented
- Measuring instruments are protected and their performance is no longer impaired
- The noise level in hydraulic systems is reduced
- The performance of machine tools is improved
- Interconnection of several pumps in one line is possible
- A pump rpm and feed pressure increase is possible
- The maintenance and servicing costs can be reduced
- The service life of the system is increased

2. APPLICATION

2.1. PULSATION DAMPING TYPE SB...P / SBO...P



2.1.1 General

The HYDAC pulsation damper

- Prevents pipe breaks caused by material fatigue, pipe oscillations and irregular flow rates,
- Protects valves, control devices and other instruments,
- Improves noise level damping

2.1.2 Applications

The pulsation damper is particularly suitable for hydraulic systems, displacement pumps, sensitive measurement and control instruments and manifolds, e.g. in process circuits in the chemical industry.

2.1.3 Mode of operation

The pulsation damper generally has two fluid ports and can therefore be fitted directly inline.

The flow is diverted in the fluid valve so that it is directed straight at the bladder or diaphragm. This causes direct contact of the flow with the bladder or diaphragm which, in an almost inertia-less operation, balances the flow rate fluctuations via the gas volume.

It particularly compensates for higher frequency pressure oscillations. The charge pressure is adjusted to individual operating conditions.

2.1.4 Design

HYDAC pulsation dampers consist of:

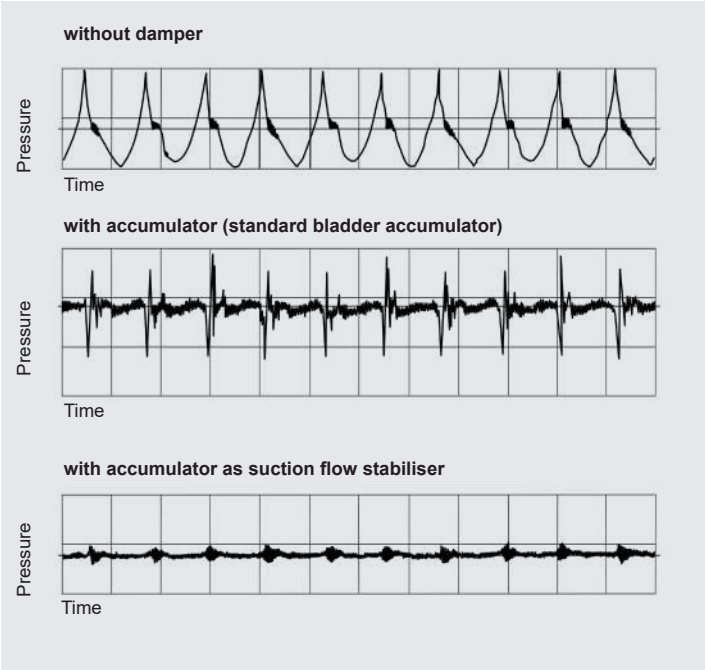
- The welded or forged pressure vessel in carbon steel; available with internal coating or in stainless steel for chemically aggressive fluids
- The special fluid valve with inline connection, which guides the flow into the vessel (threaded or flange connection)
- The bladder or diaphragm in various elastomers as shown in section 4.1.

2.1.5 Installation

As close as possible to the pulsation source. Mounting position preferably vertical (gas valve pointing upwards).

Preferred and alternative installation positions are shown in schematic form in section 1.3.

2.2. SUCTION FLOW STABILISATION



2.2.1 General

The HYDAC suction flow stabiliser

- Improves the NPSH value of the system
- Prevents cavitation of the pump
- Prevents pipe oscillations

2.2.2 Applications

Main application areas are piston and diaphragm pumps in public utility plants, reactor construction and the chemical industry.

2.2.3 Mode of operation

Trouble-free pump operation is only possible if no cavitation occurs in the pump suction and pipe oscillations are prevented.

A relatively high fluid volume in the suction flow stabiliser in relation to the displacement volume of the pump reduces the acceleration effects of the fluid column in the suction line. An air separation is also achieved due to the extremely low flow rate in the suction flow stabiliser and the deflection on a baffle. By adjusting the charging pressure of the bladder to the operating conditions, the best possible damping is achieved.

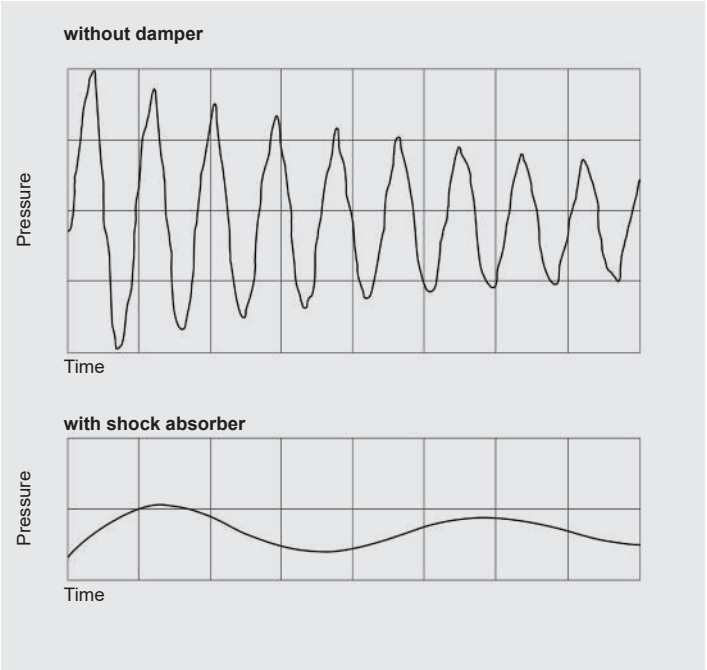
2.2.4 Design

The HYDAC suction flow stabiliser consists of a welded vessel in steel or stainless steel.
The inlet and outlet are on opposite sides and are separated by a baffle, other versions on request. The upper part houses the encapsulated bladder. In addition, there is a vent screw in the end cap and a drainage facility on the bottom.

2.2.5 Installation

As close as possible to the suction inlet of the pump. Vertical mounting position (gas valve pointing upwards).

2.3. SHOCK ABSORPTION



2.3.1 General

The HYDAC shock absorber

- Reduces pressure shocks
- Protects pipelines and valves from being destroyed

2.3.2 Applications

The accumulators are particularly suitable for use in pipelines with quick-acting valves or flaps and whilst pumps are being switched on and off.

They are also suitable for energy storage in low pressure applications.

2.3.3 Mode of operation

Sudden changes in pipeline flow, such as those caused by pump failure or the closing or opening of valves, can cause pressures which are many times higher than the normal values.

The shock absorber prevents this by converting potential energy into kinetic energy and vice versa. This prevents pressure shocks and protects pipelines, valves, monitoring instruments and other pipe fittings from destruction.

2.3.4 Design

The shock absorption can be provided by using bladder, piston and diaphragm accumulators. Further technical details on the individual accumulator types can be found in the following brochure sections:

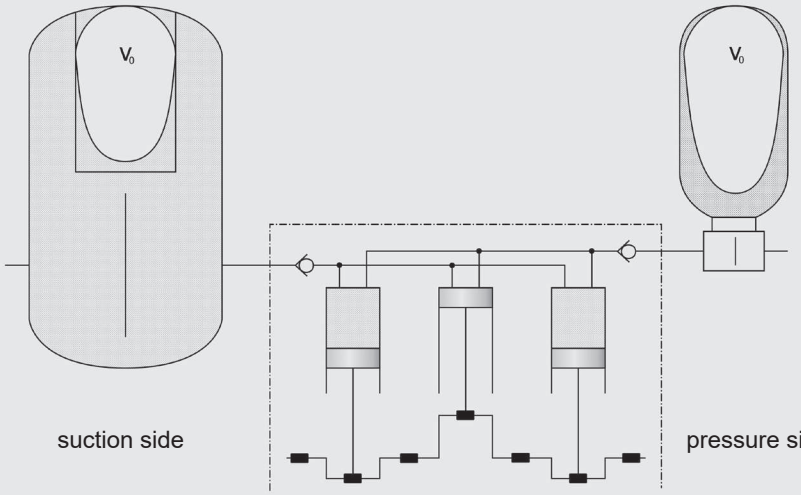
- Bladder accumulators, low pressure
  No. 3.202
- Bladder accumulators, standard design
  No. 3.201
- Diaphragm accumulators
  No. 3.100
- Piston accumulators, standard design
  No. 3.301

2.3.5 Installation

As close as possible to the source of the erratic condition. Vertical mounting position (gas valve pointing upwards).

3 SIZING

3.1. PULSATION DAMPER AND SUCTION FLOW STABILISER



On the suction side and the pressure side of piston pumps there are almost identical conditions in terms of the irregularity of the flow rate. Therefore, the same formulae for determining the effective gas volume are used to calculate the damper size. The fact that two completely different damper types are ultimately used is due to the different acceleration and pressure ratios on the two sides.

When selecting the pulsation damper, it is not only the gas volume V_0 which is a decisive factor. The connection size of the pump also has to be taken into account. In order to avoid additional cross-section variations, which represent reflection points for vibrations, and to keep pressure drop to a reasonable level, the fitting cross-section of the damper must be the same as that of the pipeline.

The gas volume V_0 of the damper is determined with the aid of the formula for adiabatic changes of state.

By giving the residual pulsation or the gas volume, the damper size can be dimensioned with the aid of the HYDAC software **ASP** (**A**ccumulator **S**imulation **P**rogram).

Designations:

ΔV = fluctuating fluid volume [l]
$\Delta V = m \cdot q$

q = stroke volume [l]

$$q = \frac{\pi \cdot d_\kappa^2}{4} \cdot h_\kappa$$

d_k = piston diameter [dm]

h_k = piston stroke [dm]

m = amplitude factor

$$m = \frac{\Delta V}{q}$$

z = no. of compressions/ effective cylinders per revolution

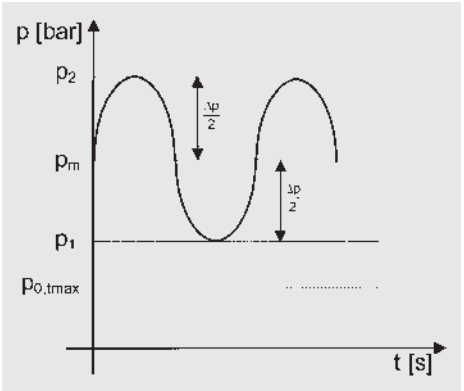
x = residual pulsation [± %]

κ = isentropic exponent

Φ = pressure ratio of pre-charge pressure to operating pressure [0.6 to 0.9]

$$\Phi = \frac{p_0}{p_m}$$

Δp = amplitude of pressure fluctuations
$\Delta p = p_2 - p_1$ [bar]



Formulae:

$$V_0 = \frac{\Delta V}{\left[\frac{\Phi}{1-\frac{x}{100}}\right]^{\frac{1}{\kappa}} - \left[\frac{\Phi}{1+\frac{x}{100}}\right]^{\frac{1}{\kappa}}}$$

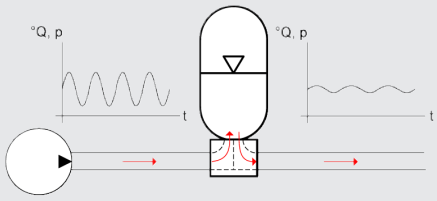
$$\Delta V = m \cdot q$$

$$x\,[\pm\%] = \left|\frac{p_1 - p_m}{p_m} \cdot 100\right|$$

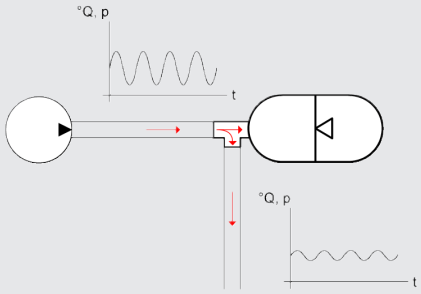
$$= \left|\frac{p_2 - p_m}{p_m} \cdot 100\right|$$

Diagram of mounting options:

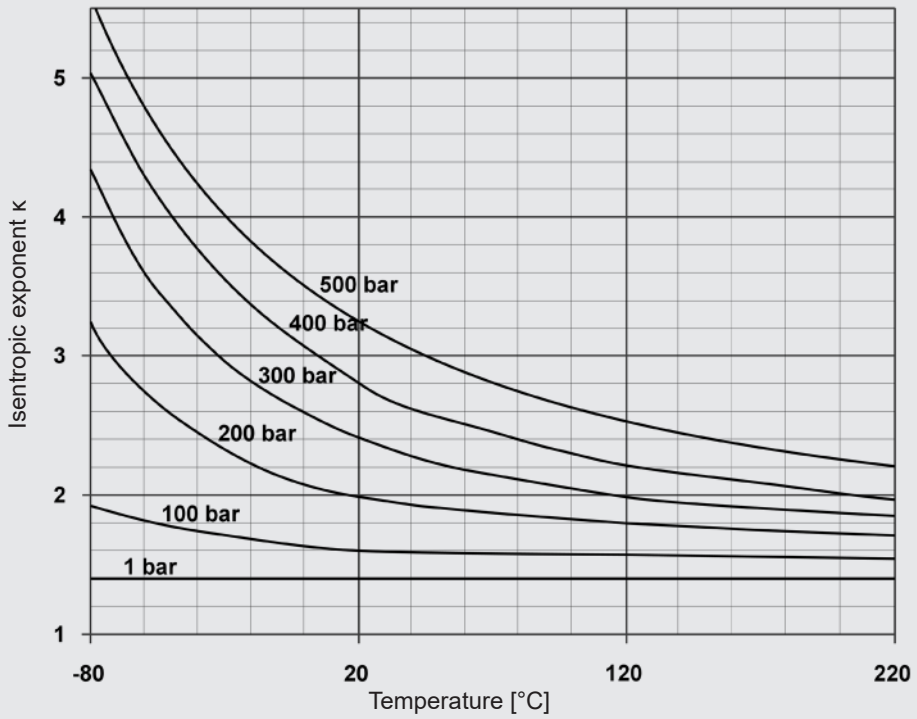
Preferred installation configuration with maximum damping effect



Alternative installation configuration using standard accumulator with a T-piece with reduced damping effect



Isentropic exponent κ dependent on pressure and temperature:



Amplitude factor (m) for piston pump:

	m value	
z	single acting	double acting
1	0.548	0.206
2	0.206	0.042

Others on request

3.1.1 Calculation example

Given parameters:

Single-acting 3-piston pump

Piston diameter:	70 mm
Piston stroke:	100 mm
Drive speed:	370 rpm
Flow rate:	427 l/min
Operating temperature:	20 °C
Operating pressure	
– pressure side:	200 bar
– suction side:	4 bar

Required:

a) Suction flow stabiliser for a residual pulsation of ±2.5 %

b) Pulsation damper for a residual pulsation of ±0.5 %

Solution:

a) Determining the required suction flow stabiliser

$$V_0 = \frac{\Delta V}{\left[\frac{\Phi}{1-\frac{x}{100}}\right]^{\frac{1}{\kappa}} - \left[\frac{\Phi}{1+\frac{x}{100}}\right]^{\frac{1}{\kappa}}}$$

$$V_0 = \frac{0{,}035 \bullet \frac{\pi \bullet 0{,}7^2}{4} \bullet 1{,}0}{\left[\frac{0{,}6}{1-\frac{2{,}5}{100}}\right]^{\frac{1}{1{,}4}} - \left[\frac{0{,}6}{1+\frac{2{,}5}{100}}\right]^{\frac{1}{1{,}4}}}$$

$V_0 = 0.54$ l

Selected: SB16S-12 with 1 litre gas volume

b) Determining the required pulsation damper

$$V_0 = \frac{\Delta V}{\left[\frac{\Phi}{1-\frac{x}{100}}\right]^{\frac{1}{\kappa}} - \left[\frac{\Phi}{1+\frac{x}{100}}\right]^{\frac{1}{\kappa}}}$$

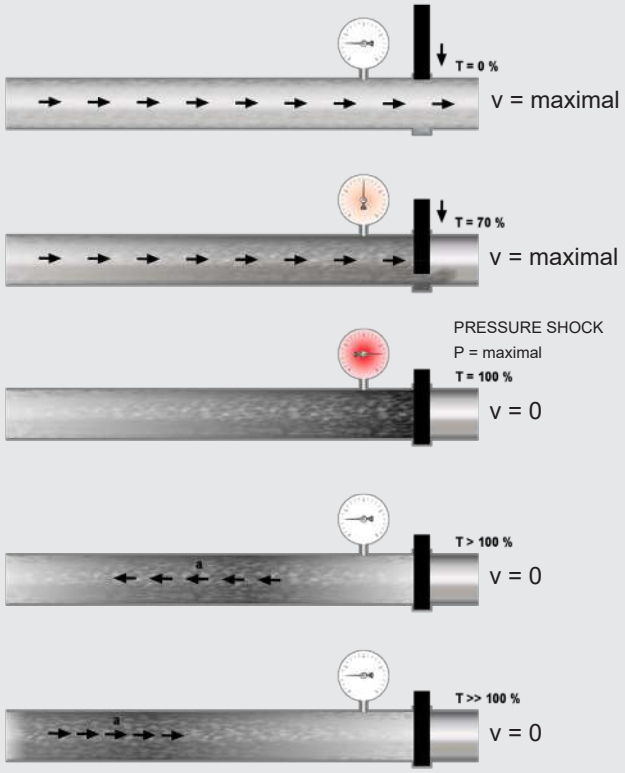
$$V_0 = \frac{0{,}035 \bullet \frac{\pi \bullet 0{,}7^2}{4} \bullet 1{,}0}{\left[\frac{0{,}7}{1-\frac{0{,}5}{100}}\right]^{\frac{1}{2{,}0}} - \left[\frac{0{,}7}{1+\frac{0{,}5}{100}}\right]^{\frac{1}{2{,}0}}}$$

$V_0 = 3.2$ l

Selected: SB330P-4

3.2. SHOCK ABSORBER

Pressure shock produced when a valve is closed without a hydraulic accumulator



Simplified pressure shock calculation for the closing of a valve

Estimate of Joukowsky's max. occurring pressure shock

$\Delta p[N/m^2]$ = $\rho \cdot a \cdot \Delta v$

ρ [kg/m³] = fluid volume

Δv = $v - v_1$

Δv = change in fluid velocity

v [m/s] = fluid velocity before the change in its condition

v_1 [m/s] = fluid velocity after the change in its condition

a [m/s] = propagation velocity of pressure wave

$$a\ [m/s] = \frac{1}{\sqrt{\rho \cdot \left[\frac{1}{K} + \frac{D}{E \cdot e}\right]}}$$

K [N/m²] = compression modulus of the fluid

E [N/m²] = elasticity modulus of the pipeline

D [mm] = internal diameter of the pipeline

e [mm] = wall thickness of the pipeline

The pressure wave runs to the other end of the pipeline and will reach the valve again after time t (reflection time), whereby:

$$t\ [s] = \frac{2 \cdot L}{a}$$

L [m] = length of the pipeline

T [s] = eff. operating time (closing) of the valve

If T < t then:

$p_{max} = p_1 + \Delta p$

If T > t then:

$$p_{max} = p_1 + \rho \cdot a \cdot \Delta v \cdot \frac{t}{T}$$

Determining the required damper size

The accumulator must absorb the kinetic energy of the fluid by converting it into potential energy within the pre-determined pressure range. The change of state of the gas is adiabatic in this case.

$$V_0 = \frac{m \cdot \Delta v^2 \cdot 0{,}4}{2 \cdot p_1 \cdot \left[\left[\frac{p_2}{p_1}\right]^{1-\frac{1}{\kappa}} - 1\right] \cdot 10^2} \cdot \left[\frac{p_1}{p_0}\right]^{\frac{1}{\kappa}}$$

m [kg] = weight of the fluid in the pipeline

v [m/s] = change in velocity of the fluid

p_1 (bar) = zero head of the pump

p_2 [bar] = perm. operating pressure

p_0 [bar] = pre-charge pressure

A special calculation program for analysing the pressure curve is available for manifold sizing or sizing with regards to pump failure or start-up.

3.2.1 Calculation example

Rapid closing of a shut-off valve in a re-fuelling line.

Given parameters:

Length of pipeline L:
2000 m

Size of pipeline D:
250 mm

Wall thickness of pipeline e:
6.3 mm

Material of the pipeline:
Steel

Flow rate Q:
432 m³/h = 0.12 m³/s

Density of medium ρ:
980 kg/m³

Zero feed height of pump p_1:
6 bar

Min. operating pressure p_{min}:
4 bar

Eff. closing time of valve T:
1.5 s
(approx. 20 % of total closing time)

Operating temperature:
20 °C

Compression modulus of fluid K:
1.62×10^9 N/m²

Elasticity modulus (steel) E:
2.04×10^{11} N/m²

Required:

Size of the required shock absorber, when the max. pressure (p_2) must not exceed 10 bar.

Solution:

Determination of reflection time:

$$a = \frac{1}{\sqrt{\rho \cdot \left[\frac{1}{K} + \frac{D}{E \cdot e}\right]}}$$

$$a = \frac{1}{\sqrt{980 \cdot \left[\frac{1}{1.62 \cdot 10^9} + \frac{250}{2.04 \cdot 10^{11} \cdot 6.3}\right]}}$$

$$a = 1120 \text{ m/s}$$

$$t = \frac{2 \cdot L}{a} = \frac{2 \cdot 2000}{1120} = 3.575 \text{ s} *$$

* since T < t the max. pressure shock occurs and the formula as shown in section 3.2. must be used.

$$v = \frac{Q}{A}$$

$$v = \frac{0.12}{0.25^2 \cdot \pi/4} = 2.45 \text{ m/s}$$

$$\Delta_p = \rho \cdot a \cdot \Delta v$$

$$\Delta_p = 980 \cdot 1120 \cdot (2.45\text{-}0) \cdot 10^{-5}$$

$$= 26.89 \text{ bar}$$

$$p_{max} = p_1 + \Delta_p$$

$$p_{max} = 6 + 26.89 = 32.89 \text{ bar}$$

Determining the required gas volume:

$$p_0 \leq 0.9 \cdot p_{min}$$

$$p_0 \leq 0.9 \cdot 5 = 4.5 \text{ bar}$$

$$V_0 = \frac{m \cdot v^2 \cdot 0.4}{2 \cdot p_1 \cdot \left[\left[\frac{p_2}{p_1}\right]^{1-\frac{1}{\kappa}} - 1\right] \cdot 10^2} \cdot \left[\frac{p_1}{p_0}\right]^{\frac{1}{\kappa}}$$

with $m = V \cdot \rho = \frac{\pi}{4} \cdot D^2 \cdot L \cdot \rho$

$$V_0 = \frac{\frac{\pi}{4} \cdot 0.25^2 \cdot 2000 \cdot 980 \cdot 2.45^2 \cdot 0.4}{2 \cdot 7 \cdot \left[\left[\frac{11}{7}\right]^{1-\frac{1}{1.4}} - 1\right] \cdot 10^2} \cdot \left[\frac{7}{4.5}\right]^{\frac{1}{1.4}}$$

$$V_0 = 1641 \text{ l}$$

Selected:

SB35AH-450

4. SPECIFICATIONS

4.1. EXPLANATIONS, NOTES

4.1.1 Operating pressure

See table for relevant series (may differ from nominal pressure for foreign test certificates).

4.1.2 Permitted operating temperatures

-10 °C ... 80 °C
Standard design, others on request

4.1.3 Nominal volume

See table for relevant series

4.1.4 Effective gas volume

See table for relevant series, based on nominal dimensions. This differs slightly from the nominal volume and must be used when calculating the effective fluid volume.

For diaphragm accumulators, the effective gas volume corresponds to the nominal volume.

4.1.5 Effective volume

Volume of fluid which is available between the operating pressures p_2 and p_1.

4.1.7 Gas charging

Hydraulic accumulators must only be charged with nitrogen.
Never use other gases.
Risk of explosion!

In principle, only use nitrogen of at least Class 4.0 (filtration < 3 µm).
If other gases are to be used, please contact HYDAC for advice.

4.1.8 Limits for gas pre-charge pressure

Ratio of maximum operating pressure p_2 to gas pre-charge pressure p_0.

The specified values are maximum values and must not be considered as referring to a permanent load. The tolerable pressure ratio is influenced by the geometry, temperature, fluid and flow rate as well as any gas losses due to physical properties.

See catalogue section:

- HYDAC Accumulator Technology No. 3.000
- Bladder accumulators Low pressure No. 3.202
- Bladder accumulators Standard design No. 3.201

4.1.9 Notice

All work on HYDAC hydraulic dampers must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.
The operating instructions must be observed!

- Bladder accumulators No. 3.201.BA
- Diaphragm accumulators No. 3.100.BA
- Piston accumulators No. 3.301.BA

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

4.1.6 Working temperature and operating medium

The permitted working temperature of a hydraulic damper is dependent on the application limits of the metal materials and the separation element. Outside this temperature range, special materials must be used. The operating medium must also be taken into account.
The following table displays a selection of elastomer materials including max. temperature range and a rough overview of resistant and non-resistant fluids. Please contact us for help in selecting a suitable elastomer.

Materials		Material code [1]	Accumulator type	Temperature range	Overview of the fluids [2]	
					Resistant to	Not resistant to
NBR	Acrylonitrile butadiene rubber	2	SB, SBO	-15 °C ... + 80 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the groups HFA, HFB, HFC ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Fuels
		5	SB, SBO	-50 °C ... + 50 °C		
		9	SB, SBO	-30 °C ... + 80 °C		
ECO	Ethylene oxide epichlorohydrin rubber	3	SB	-30 °C ... +120 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the HFB group ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the groups HFA and HFC ● Fuels
			SBO	-40 °C ... +120 °C		
IIR	Butyl rubber	4	SB	-50 °C ... +100 °C	● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the group HFC ● Water	● Mineral oils and mineral greases ● Synthetic esters (HEES) ● Aliphatic, chlorinated and aromatic hydrocarbons ● Fuels
			SBO	-50 °C ... +120 °C		
FKM	Fluorine rubber	6	SB, SBO	-10 °C ... +150 °C	● Mineral oil (HL, HLP) ● Hydraulic fluids from the group HFD ● Synthetic esters (HEES) ● Fuels ● Aromatic hydrocarbons ● Inorganic acids	● Amines and ketones ● Ammonia ● Skydrol and HyJet IV ● Steam

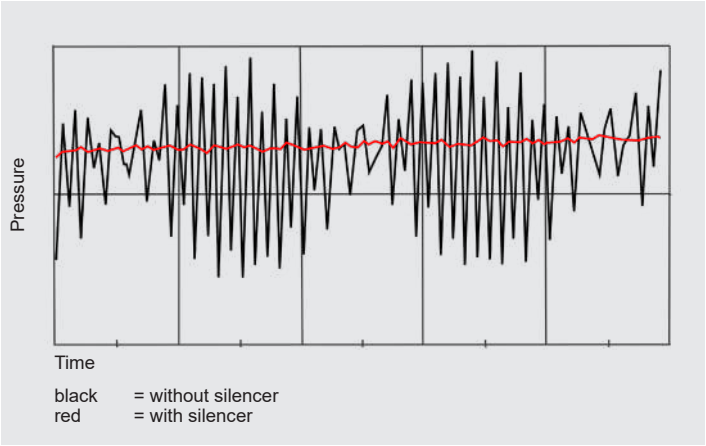
5. SILENCER

5.1. APPLICATION

Silencer for fluid noise damping
Type SD...



5.1.1 General

All displacement pumps, such as axial and radial piston pumps, vane, gear or screw pumps produce volume and pressure fluctuations which are exhibited as vibrations and noises. Noises are not only generated and transmitted by the pump. They are also the result of mechanical vibrations and vibrations caused by the fluid pulsations, which are amplified when transmitted to larger surfaces. Insulation, the use of flexible hoses and silencer covers can only provide partial solutions to the problem as they do not prevent transmission to other areas.

5.1.2 Applications

Vehicles, machine tools, plastics machinery, aeroplanes, ships, hydraulic power stations and other systems with a large "surface" are all applications where the noise level can be reduced.

5.1.3 Mode of operation

The HYDAC fluid SILENCER is based on the principle of an expansion chamber with interference line.

By reflecting the oscillations within the silencer the majority of the oscillations are dampened across a wide frequency spectrum.

5.1.4 Design

The SILENCER consists of a housing, an internal tube and two pipe connections on opposite sides. It has no moving parts and no gas charge and is therefore absolutely maintenance free.

The SILENCER can be used for mineral oils, phosphate ester and water glycol. A stainless steel model is available for other fluids.

5.1.5 Installation

It is recommended that one connection side is joined via a flexible hose in order to reduce the transmission of mechanical vibrations. The damper can be installed in any position.

5.1.6 Permitted operating temperatures

-20 °C ... +80 °C

5.1.7 Notice

All work on HYDAC silencers must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.
The operating instructions must be observed!
No. 3.701.BA

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

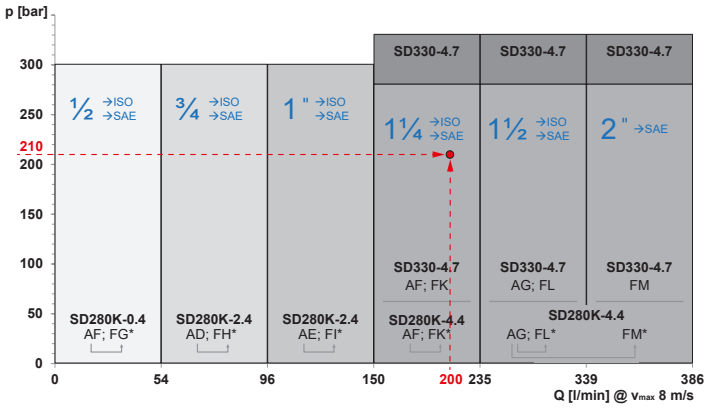
- HYDAC Accumulator Technology
  No. 3.000

Relevant PDF documents can be accessed at:
www.hydac.com » Downloads » Documents » Accumulator Division

5.2. SIZING

Universal broadband silencer
Series SD330, SD280K

With the aid of a few details (max. pressure and nominal flow), the appropriate silencer type for the particular application can easily be chosen by using the following pressure/flow rate matrix.



* SD280K model: ISO connection can be converted to an SAE flange connection (see section 5.4.2)

Example of the selection process:

Max. operating pressure p = 210 bar
Flow rate Q = 200 l/min

The following versions can be selected, depending on the connection system available:

- SD330-4.7…AF/AF
- SD330-4.7…FK/FK
- SD280K-4.4…AF/AF
  → with SAE adapter (section 5.4.2), can be converted to FK/FK

Customer-specific versions

For special applications, the HYDAC SILENCER can be dimensioned to suit the application.

This can be done on the basis of a piston accumulator or a diaphragm accumulator.

The starting point for the selection table is to determine the level of transmission damping D from 20 dB upwards.

$$D = 20 \cdot \log \frac{\Delta p_o}{\Delta p_m}$$

Δp_o = amplitude of pressure fluctuations without silencer
Δp_m = amplitude of pressure fluctuations with silencer

When selecting the damper the following has to be taken into account:

1) the size of the silencer body
2) the fundamental frequency f of the pump
   f = i • n / 60 in Hz
   i = number of displacement elements
   n = rotational speed in rpm

By calculating the fundamental frequency and using the system data (e.g. pipe length, ball valves, pressure, temperature, etc.) we can determine the correct size of silencer for you.

Use the specification sheet to provide the required data quickly and conveniently on a PC and send it to us.
See www.hydac.com or catalogue section:

Accumulator stations

1. GENERAL

HYDAC supplies fully assembled piston accumulator stations which are ready for operation, complete with all the necessary valve controls, pipe fittings and safety devices

- As an individual accumulator unit or
- In a back-up version with nitrogen bottles to increase the effective volume

The HYDAC system approach creates a HYDAC system of, for example, bladder or piston accumulator stations, by integrating individual HYDAC components.

An accumulator station can be composed of:

- Piston accumulators with nitrogen bottles
- Bladder accumulators with nitrogen bottles or
- Nitrogen bottles alone

The modular design of the accumulator stations enables HYDAC to incorporate all customer requirements. Taking the customer's own operating data into account, HYDAC can calculate the required accumulator volumes using the accumulator simulation program:

- **ASP** – **A**ccumulator **S**imulation **P**rogram.

Please read the relevant operating instructions for the individual HYDAC components!

2. MODEL CODE

(also order example)

SS350 K – 4 x 250 / 12 x 320 (U)

Series
SS = accumulator station
e.g. SS350 = accumulator station with a p_{max} of 350 bar

Type code letter
K = piston accumulator
B = bladder accumulator
N = nitrogen bottles

Number of hydraulic accumulators

Nominal volume [l] of the hydraulic accumulators

Number of nitrogen bottles

Nominal volume [l] of nitrogen bottles

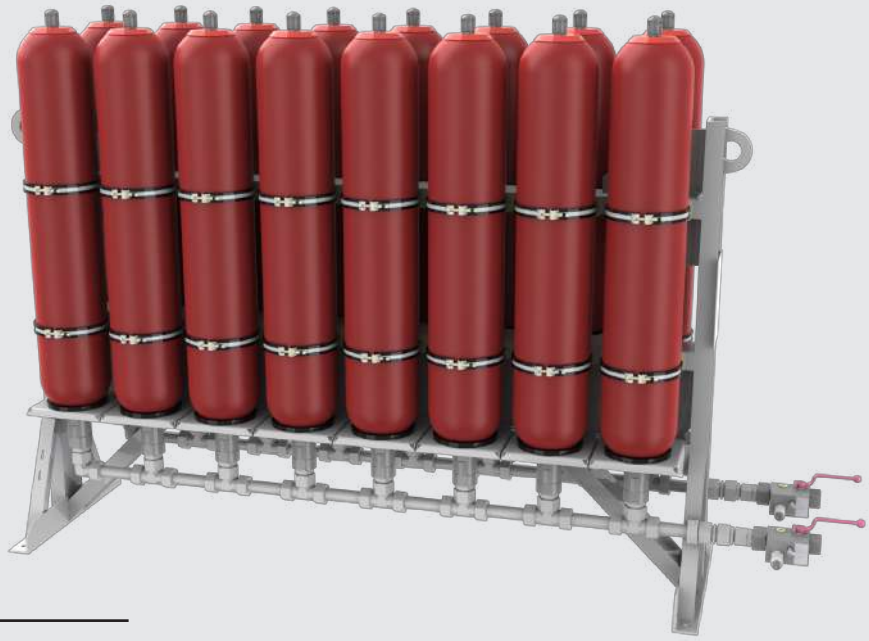
Certification code
(U) = European Pressure Equipment Directive (PED)

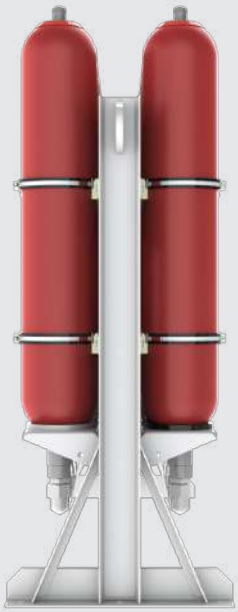
3. EXAMPLES OF ACCUMULATOR STATIONS

3.1. BLADDER ACCUMULATOR STATIONS

EXAMPLE: SS330B-16x32(U)

Technical data:
16 bladder accumulators, each with a volume of 32 l
max. operating pressure: 330 bar

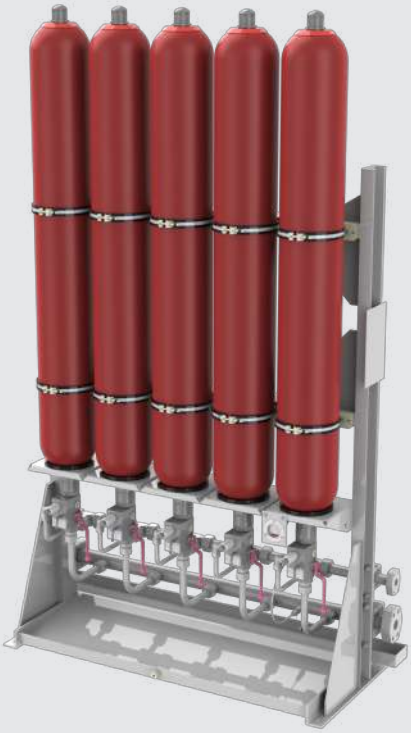




Dimensions		
Length [mm]	Width [mm]	Height [mm]
2780	660	1950

EXAMPLE: SS330B-5x50(U)

Technical data:
5 bladder accumulators, each with a volume of 50 l
max. operating pressure: 330 bar



DIMENSIONS		
Length [mm]	Width [mm]	Height [mm]
1640	600	2750

3.2. PISTON ACCUMULATOR STATIONS

EXAMPLE: SS350K-1x110/8x50(U)

Technical data:
1 piston accumulator, volume 110 l
8 N_2 bottles, each with a volume of 50 l
max. operating pressure: 350 bar

Dimensions		
Length [mm]	Width [mm]	Height [mm]
1540	900	3300

EXAMPLE: SS220K-1x120/1x75(U)

Technical data:
1 piston accumulator, volume 120 l
1 N_2 bottle, volume 75 l
max. operating pressure: 220 bar

Dimensions		
Length [mm]	Width [mm]	Height [mm]
520	800	3500

EXAMPLE: SS210K-1x110/2x50(U)

Technical data:
1 piston accumulator, volume 110 l
2 N_2 bottles, each with a volume of 50 l
max. operating pressure: 210 bar

Dimensions		
Length [mm]	Width [mm]	Height [mm]
950	475	2840

EXAMPLE: SS350K-1x200/2x110(A9)

Technical data:
1 piston accumulator, volume 200 l
2 N_2 bottles, each with a volume of 110 l
max. operating pressure: 350 bar

Dimensions		
Length [mm]	Width [mm]	Height [mm]
1250	550	2900

3.3. NITROGEN BOTTLES

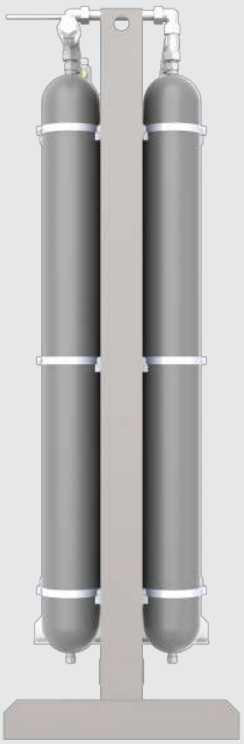
Nitrogen bottles in a modular design:
up to 24 bottles can be assembled on a frame in this version.
For a larger quantity, a special design can be supplied.

See catalogue section:

- Hydraulic accumulators with back-up nitrogen bottles
  No. 3.553

EXAMPLE: SS350N-16x75(U)

Technical data:
16 N_2 bottles, each with a volume of 75 l
max. operating pressure: 350 bar



Dimensions		
Length [mm]	Width [mm]	Height [mm]
2440	900	3000

Hydraulic accumulators with back-up nitrogen bottles

1. GENERAL

To complete the accumulator range, HYDAC provides a variety of useful accessory products. They guarantee correct installation and optimum functioning of HYDAC hydraulic accumulators. They include nitrogen bottles which can be used to back up bladder and piston accumulators. Nitrogen bottles used as back-ups increase the gas volume in the accumulator system. This means that smaller accumulators can be used for the same gas volume and costs can be reduced.

For further information, please turn to the sections:

- Bladder accumulators
  Standard design
  No. 3.201
- Piston accumulators
  Standard design
  No. 3.301

1.1. NOTICE

All work with HYDAC hydraulic accumulators / nitrogen bottles must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.
The operating instructions must be observed!

- Operating instructions for bladder accumulators SB
  No. 3.201.BA
- Operating instructions for piston accumulators SK
  No. 3.301.BA
- Operating instructions for gas pressure vessels GDB
  No. 3.553.BA

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

- HYDAC Accumulator Technology
  No. 3.000

www.hydac.com » Downloads » Documents » Accumulator Division

2. BACK-UP VERSIONS

2.1. SET-UP USING THE EXAMPLE OF A BLADDER ACCUMULATOR

Based on bladder accumulator models 20 ... 50 l, the gas side of these accumulators is specially designed to connect to nitrogen bottles. A diffuser rod prevents damage to the bladder when the accumulator is charged. This design can also be used for the separation of fluids (taking into account the volume ratios which apply to bladder accumulators).

[1] Different dimensions for code 663 and 665

[2] FPS adapter (item 34) available as an accessory, see section 4.2.

Accumulator shell (item 1) not available as a spare part

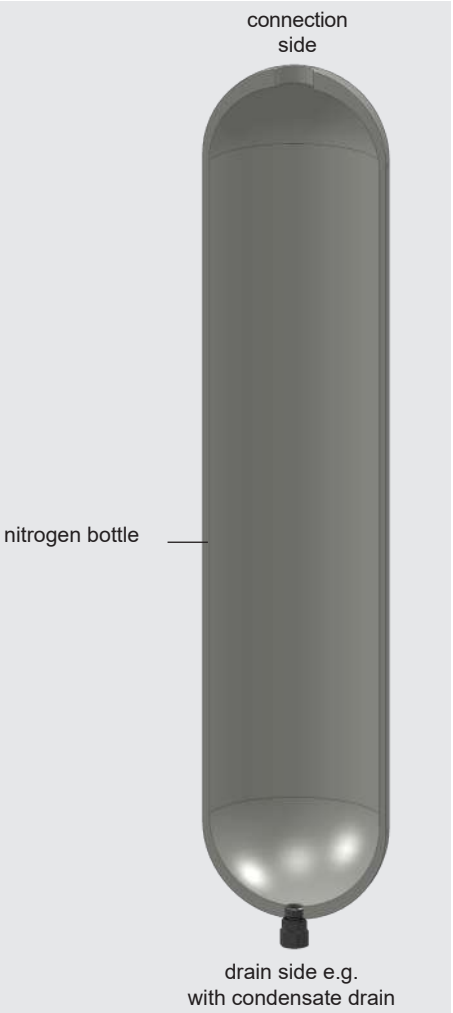
Adapter (item 25) incl. O-ring (item 27) available as an accessory, see catalogue section:
Bladder accumulators, Standard design
No. 3.201, section 4.

Adapter (item 32) for type 1 standard

For other spare parts, see section 3.

3. NITROGEN BOTTLES

3.1. DESCRIPTION AND DESIGN



HYDAC nitrogen bottles are used for receiving and storing nitrogen.

HYDAC supplies various versions, such as standard nitrogen bottles made from forged vessels and special vessels based on bladder accumulator shells (SN...B), piston accumulator tubes (SN...K) and diaphragm accumulator halves (SN...M) – see catalogue sections:

- Bladder accumulators
  Standard design
  No. 3.201
- Piston accumulators
  Standard design
  No. 3.301
- Diaphragm accumulators
  No. 3.100

The following technical specifications refer to standard nitrogen bottles. Please ask us for information regarding other designs.

3.2. ADVANTAGES

Using HYDAC nitrogen bottles provides the following advantages:

- Cost-effective increase in the accumulator volume and
- smaller accumulators for the same gas volume as a result.

3.3. SPECIFICATIONS

3.3.1 Model code

Not all combinations are possible.

4. ACCESSORIES

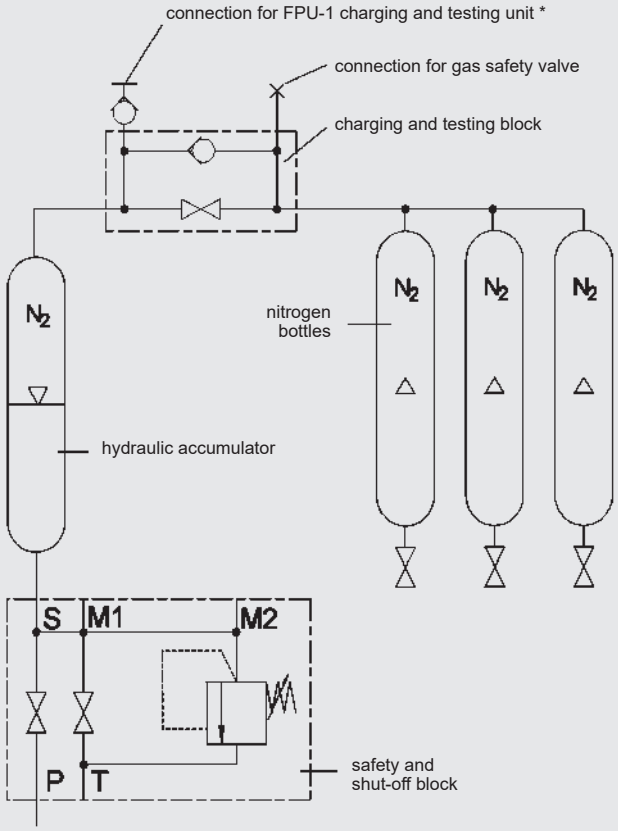
4.1. F + P CHARGING AND TESTING BLOCK

4.1.1 Description

The HYDAC F + P charging and testing block is used to charge and test back-up type hydraulic accumulators. It has connections for the FPU-1 charging and testing unit and for pressure gauges. As a safety function, a GSV6 gas safety valve can be fitted (see catalogue section given below). In addition, it allows the back-up nitrogen bottles to be shut off from the hydraulic accumulator.

- Safety equipment for hydraulic accumulators
  No. 3.552

4.1.2 Hydraulic circuit with charging and testing block



* For further information, see catalogue section:
- FPU charging and testing unit
  No. 3.501

4.1.3 Preferred models / spare parts

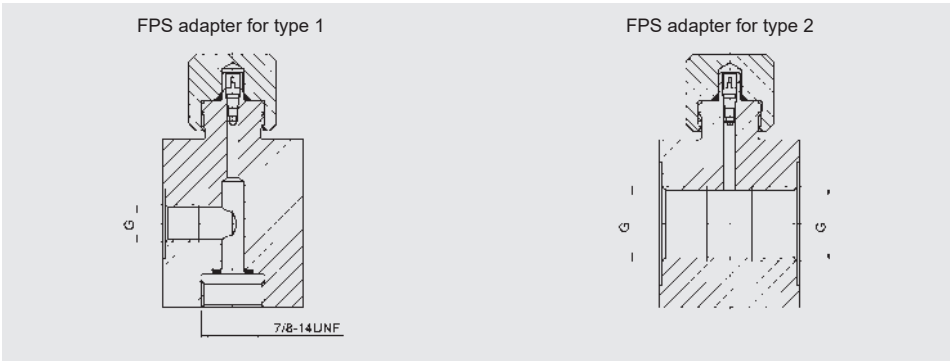
4.2. FPS ADAPTER

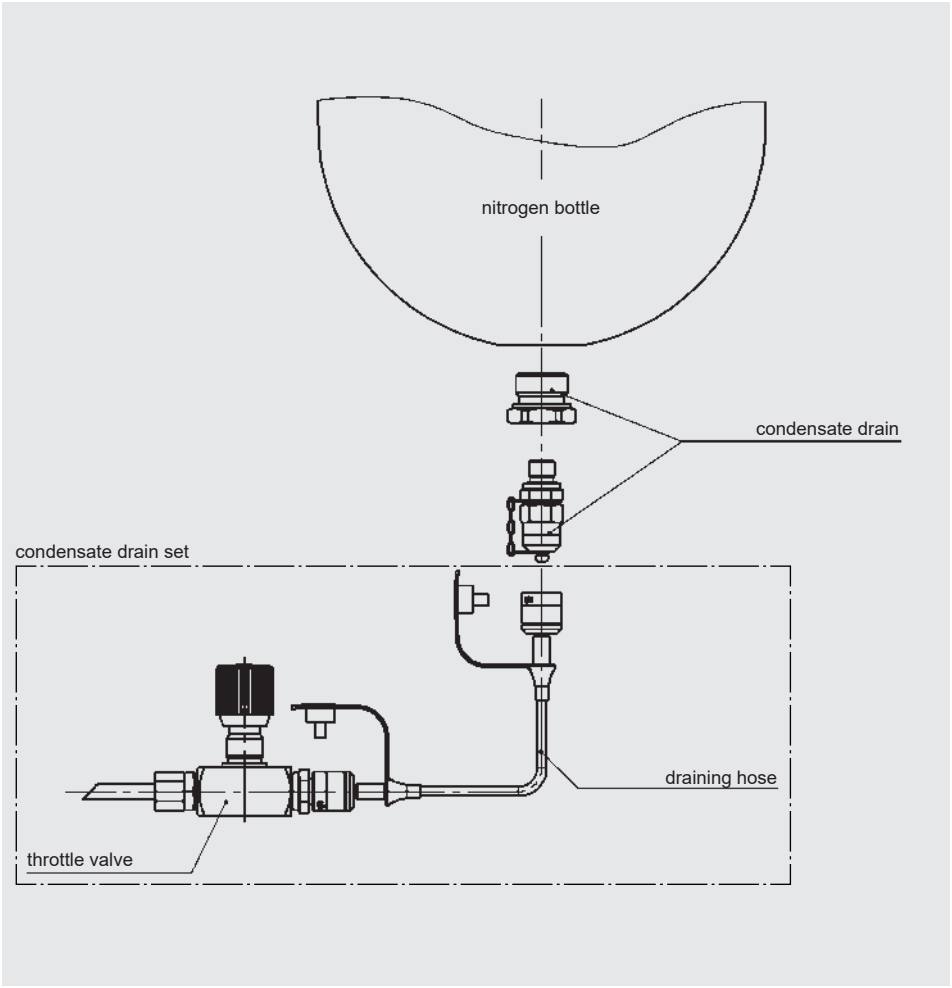
The HYDAC FPS adapter is used to charge back-up type hydraulic accumulator systems. For this purpose, it has a connection for the FPU-1 charging and testing unit.



Designation	G ISO 228	Part no.	Type
Adapter FPS 7/8-14UNF	G 3/4	363226	1
Adapter FPS	G 3/4	243218	2

4.3. CONDENSATE DRAIN SET

The condensate drain set consists of a throttle valve and a suitable condensate draining hose.
It is used to drain any condensate from the nitrogen bottle, in a controlled way.



Designation	Length [m]	Part no.
Condensate drain G 3/4 – Minimess M16x1.5	–	3219496
Condensate drain set	0.4	3472820
	1	3472823
	1.6	3472824

4.3. NITROGEN CHARGING UNIT

HYDAC nitrogen charging units make it possible to rapidly and inexpensively charge or test the required gas pre-charge pressures in bladder, piston and diaphragm accumulators. They guarantee an optimal utilisation of standard commercial nitrogen bottles up to a residual pressure of 20 bar and a maximum pre-charge pressure of 350 bar. Portable, mobile and stationary N_2-Server versions are available.

For further information and technical data, see the following brochure:

- Nitrogen charging units N_2-Server No. 2.201

Higher pressures available on request.

5. NOTE

The information in this brochure relates to the operating conditions and fields of application described. For applications and/or operating conditions not described, please contact the relevant technical department. Subject to technical modifications.

FPU
Charging and testing unit
for bladder, piston
and diaphragm accumulators

1. DESCRIPTION

1.1. FUNCTION

The HYDAC FPU charging and testing unit is used to charge accumulators with nitrogen or to check or change the existing pre-charge pressure in accumulators. For this purpose, the charging and testing unit is screwed onto the gas valve of the hydraulic accumulator and connected to a nitrogen bottle via a flexible hose with a pressure reducer (see diagram of design with FPU-1, right).

The A3 adapter is needed to charge and test the HYDAC bladder accumulator (included in scope of delivery).

HYDAC nitrogen charging units make it possible to rapidly and inexpensively charge or test the required gas pre-charge pressures in bladder, piston and diaphragm accumulators. They guarantee an optimal utilisation of standard commercial nitrogen bottles up to a residual pressure of 20 bar and a maximum pre-charge pressure of 350 bar. Portable, mobile and stationary N2-Server versions are available.

For further information and technical data, see catalogue section:

- Nitrogen charging units N2-Server No. 2.201

Higher pre-charge pressures up to 470 bar available on request.

Notice

All work with HYDAC charging and testing units must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.
The operating instructions must be observed!
No. 3.501.BA

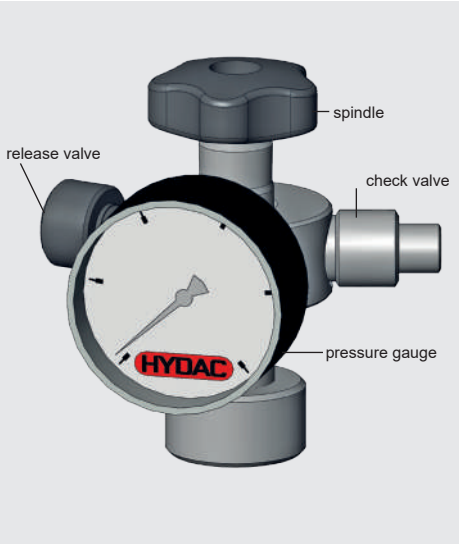
www.hydac.com » Downloads » Documents » Accumulator Division

1.2. DESIGN

The HYDAC charging and testing unit FPU-1 for bladder, piston and diaphragm accumulators consists of a primary body with the following:

- Spindle
- Check valve
- Release valve
- Pressure gauge

(for ports, see section 3.)



1.3. DIAGRAM OF CHARGING AND TESTING PROCEDURE

The following illustration shows the typical design of the charging and testing procedure for a HYDAC bladder accumulator used in connection with a nitrogen bottle (200 bar).

For other accessories, see section 4.

2.2. FPU-1 STANDARD DESIGNS

The basic version of the FPU-1 (p_{max} = 350 bar, -10 °C ... +80 °C) is the minimum equipment required to test and set the pre-charge pressure (p_0) at the hydraulic accumulator. It comprises of the FPU-1, the charging hose and the A3 adapter for bladder accumulators and is supplied in a practical protective case.

The following versions are available:

Part no.*	Pressure gauge display up to [bar]	Pressure reducer [bar]	Charging hose [m]	G adapter

2.3. FPU-1 SPECIAL DESIGNS

In addition to the standard FPU-1, HYDAC supplies special designs, such as:

- designs with a digital pressure gauge
- designs with additional ports (e.g. Minimess M16x2)
- designs for aggressive media

We are able to provide detailed information on request.

2.4. HIGH PRESSURE VERSIONS

The FPU-2 was specifically designed for high pressure applications. Just like the FPU-1, the FPU-2 can be used for universal applications.
It can be screwed on directly for charging and/or testing HYDAC piston and diaphragm accumulators.
In connection with a HYDAC bladder accumulator, the A3H high pressure adapter must be used. This is not included in standard delivery.

2.4.1 Technical Data

Model code:
See section 2.1.

Max. operating pressure:
800 bar

Pressure gauge display range:
0 - 1000 bar (0 - 14500 psi)

Material:
Stainless steel 1.4313

Operating temperature:
-10 °C ... +80 °C

2.4.2 FPU-2 standard designs

The following versions are exclusively suitable for use with a pressure booster system.

Other versions on request.

Models without protective case

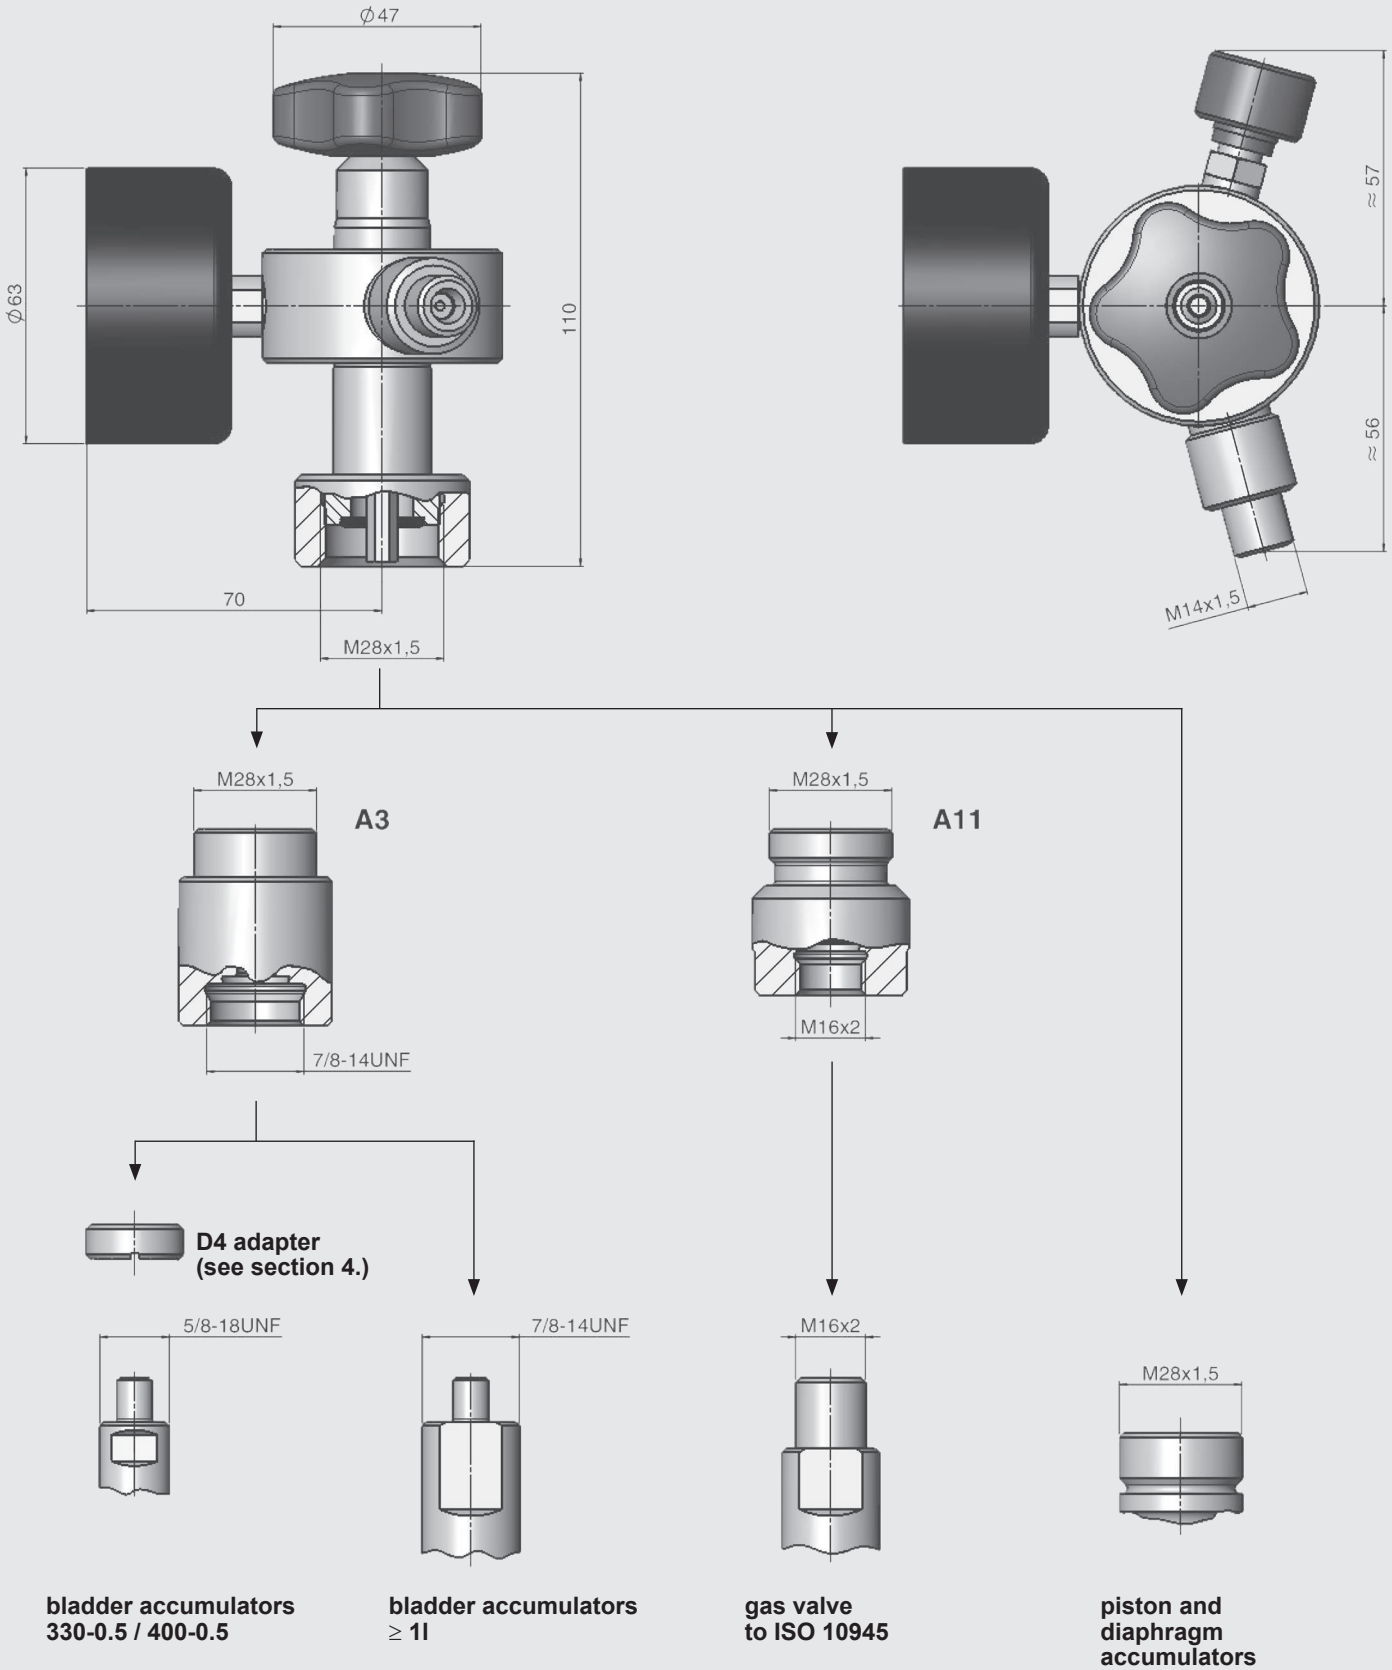
Designation	Part no.
FPU-2-800/1000F6	4043456
FPU-2-800/1000F6A3H	4043455

Models with protective case

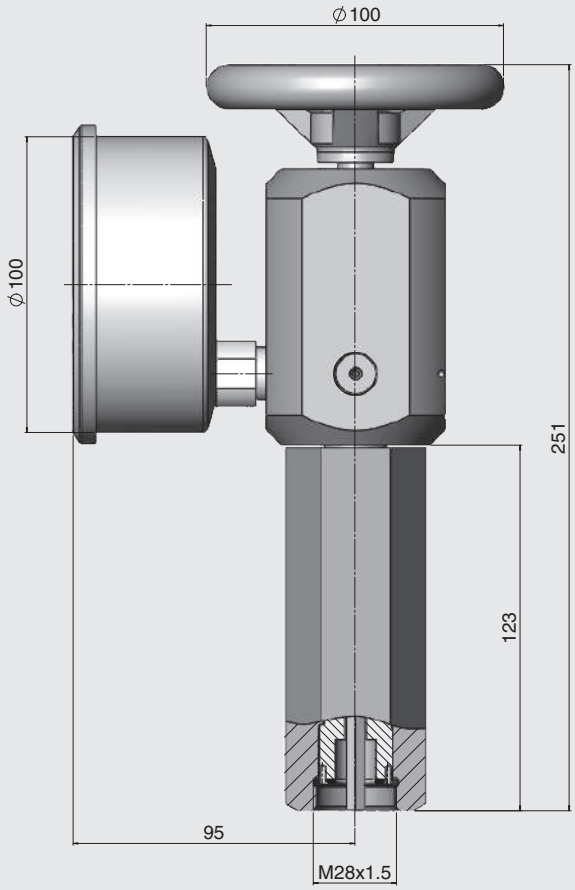
Designation	Part no.
FPU-2-800/1000F6K	4029954
FPU-2-800/1000F6A3HK	4023260

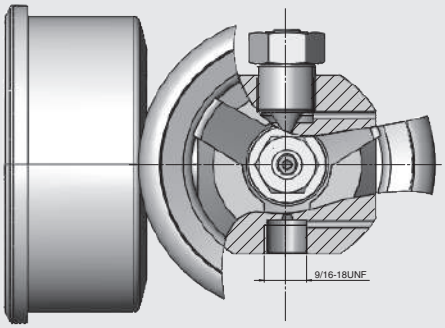
3. DIMENSIONS AND CONNECTIONS

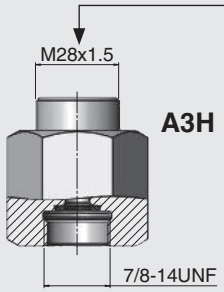
3.1. DESIGN OF FPU-1 CHARGING AND TESTING UNIT WITH ADAPTER FOR HYDAC ACCUMULATOR

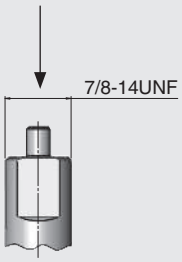


3.2. DESIGN OF FPU-2 CHARGING AND TESTING UNIT WITH ADAPTER FOR HYDAC ACCUMULATOR









bladder accumulators ≥ 1 l

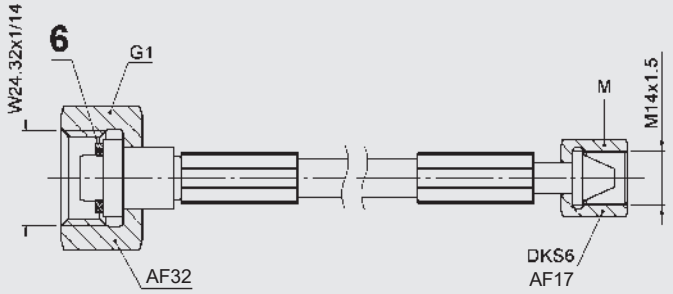
piston and diaphragm accumulators

3.3. CHARGING HOSES

Charging hoses are designed for the particular maximum permitted operating pressure marked on them and 10,000 charging processes.
(HYDAC charging hoses comply with DIN EN ISO 4413 and DIN EN 853 to 857)

3.3.1 **Charging hoses for nitrogen bottles up to 200 bar**

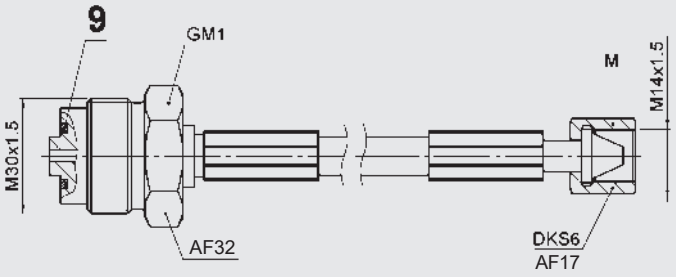
F charging hose
Connection to DIN 477, Part 1



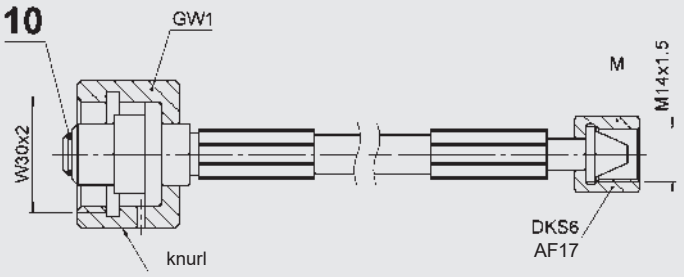
Type	Length [m]	Part no.
F charging hose	2.5	236514
	4	236515
	10	373405
	15	2115552
	20	2109765
	28	2109574

3.3.2 **Charging hoses for nitrogen bottles up to 300 bar**

FM charging hose
Connection to DIN 477, Part 5 up to April 2002



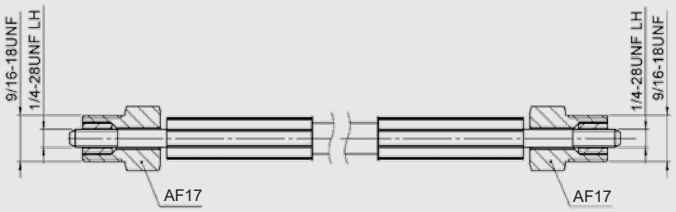
FW charging hose
Connection to DIN 477, Part 5 from April 2002



Type	Length [m]	Part no.
FM charging hose	2.5	3019417
	4	3019418
FW charging hose	2.5	3019419
	4	3019420

3.3.3 **Pressure hose for pressure booster systems**

FH charging hose



Type	Length [m]	Part no.
FH charging hose	6	6169682

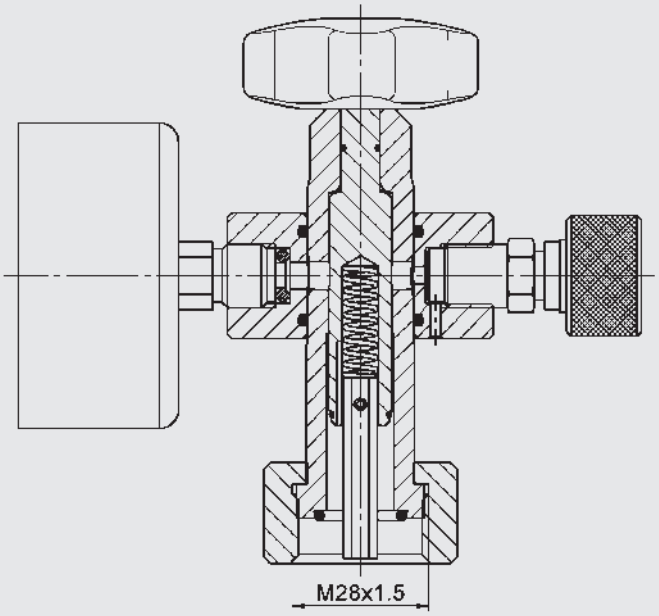
3.4. ADAPTERS FOR FPU

3.4.1 **FPU-1**

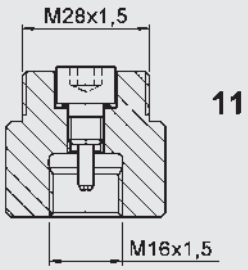
The FPU-1 can be screwed onto piston and diaphragm accumulators directly. In connection with a bladder accumulator, the A3 adapter must be used. The A3 adapter is included in the scope of delivery as standard.

Additional adapters can be used to charge and test other brands of accumulator.

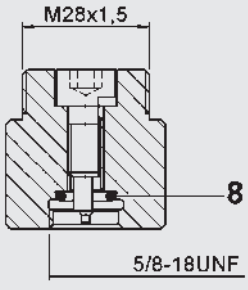
The following adapters are to be used exclusively with the FPU-1, see also section 3.1.



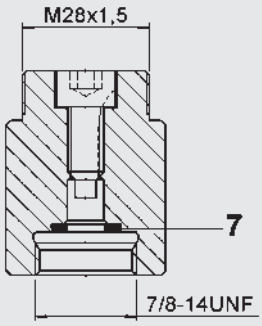
A1 (part no. 361619)



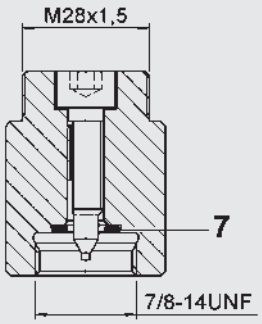
A2 (part no. 361605)



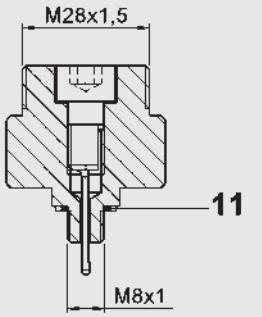
A3 (part no. 291533)



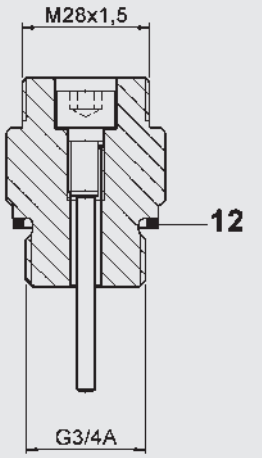
A4 (part no. 291536)



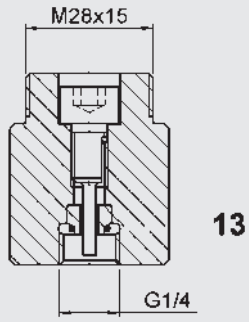
A5 (part no. 291531)



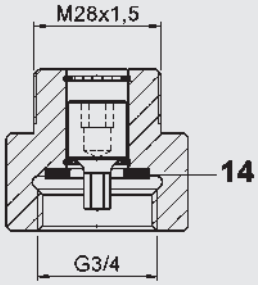
A6 (part no. 2108819)



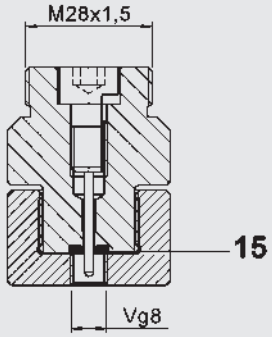
A7 (part no. 2110629)



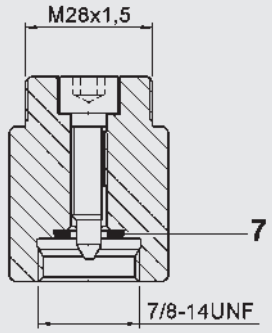
A8 (part no. 2124524)



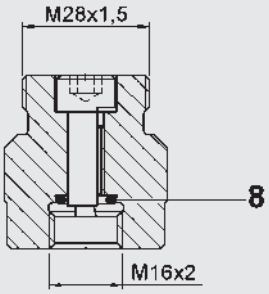
A9 (part no. 2128638)



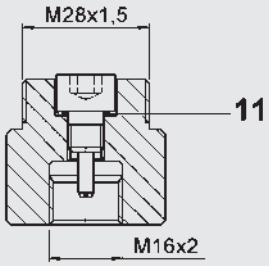
A10 (part no. 2128849)



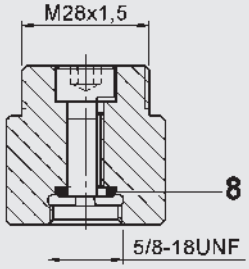
A11 (part no. 3018210)



A12 (part no. 3203185)



A13 (part. no. 3911267)

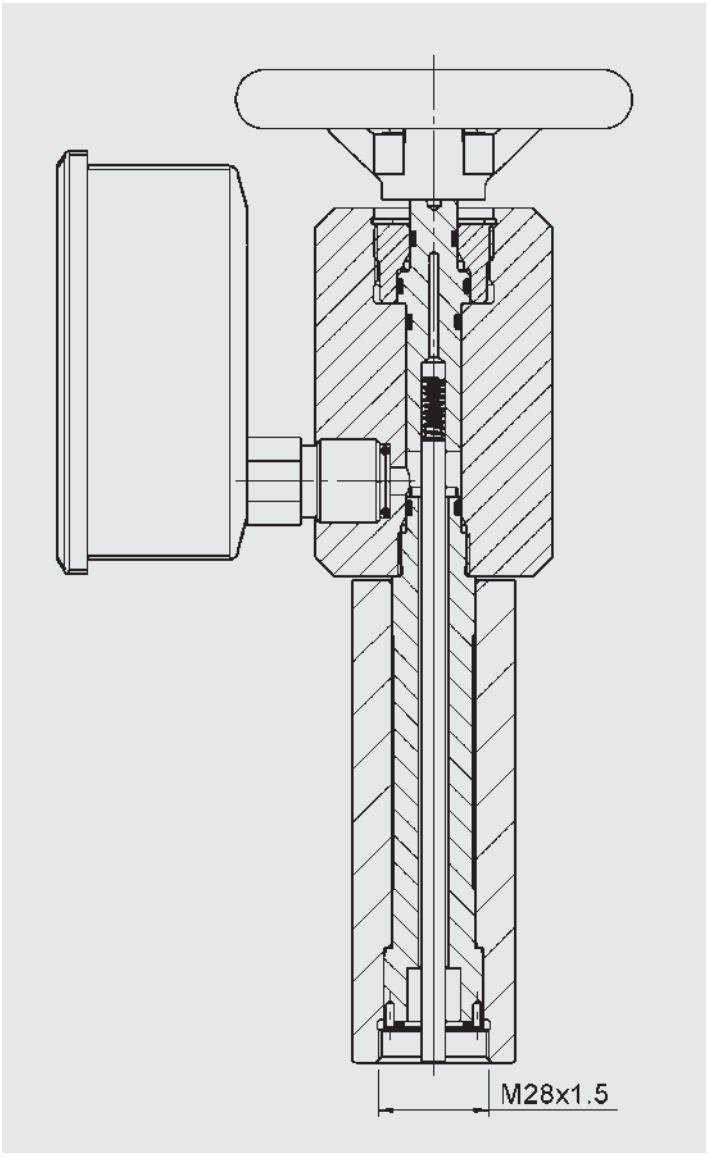


3.4.2 **FPU-2**

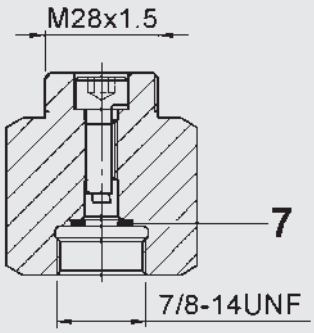
The FPU-2 can be screwed onto piston and diaphragm accumulators directly. In connection with a bladder accumulator, the A3H adapter must be used. This is not included in standard delivery.

Additional adapters can be used to charge and test other brands of accumulator.

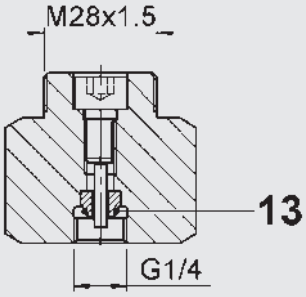
The following adapters are to be used exclusively with the FPU-2, see also section 3.2.



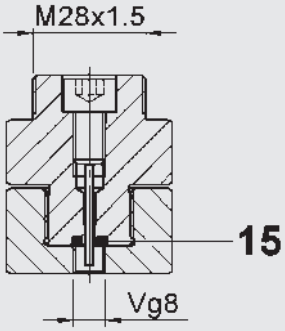
A3H (part no. 3963048)



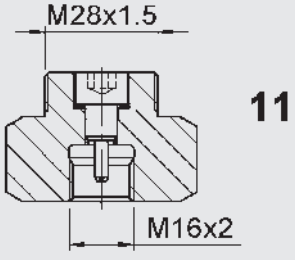
A7H (part no. 4237124)



A9H (part no. 4322422)



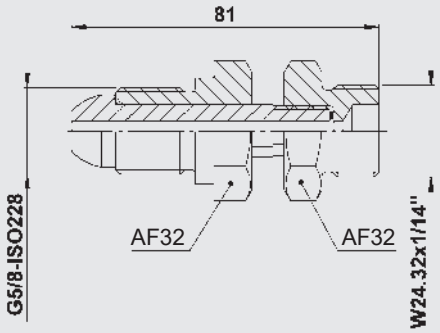
A12H (part no. 4237689)



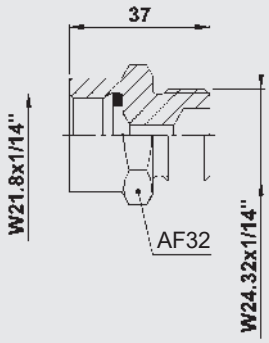
3.5. ADAPTER FOR FPU-1

The FPU-1 can be used with nitrogen bottles from various countries. Depending on the particular country of manufacture for the nitrogen bottles (see list of countries), HYDAC offers the following G adapters, exclusively for use with the FPU-1. The FPU-2 is connected to a pressure booster system.

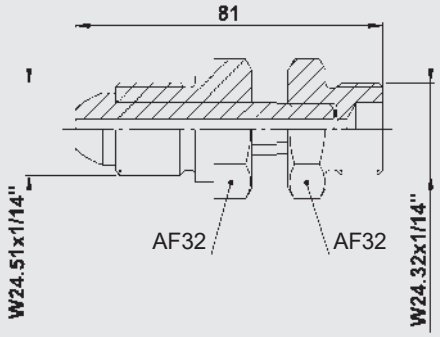
G 2 (part no. 236376)



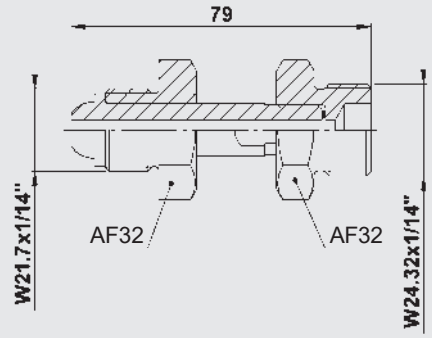
G 3 (part no. 2103421)



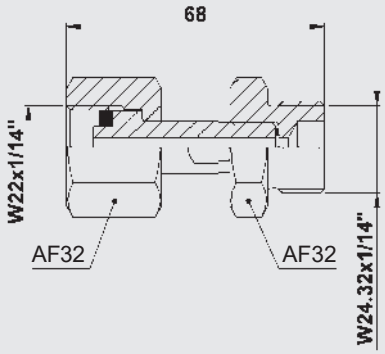
G 4 (part no. 236374)



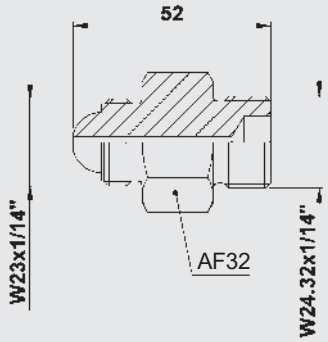
G 5 (part no. 236373)



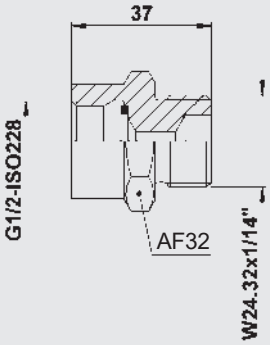
G 6 (part no. 2103423)



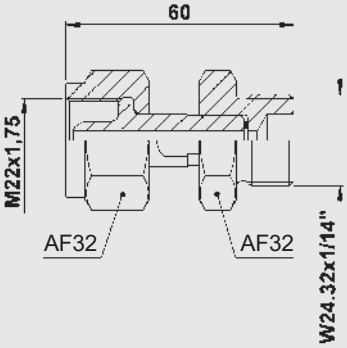
G 7 (part no. 236377)



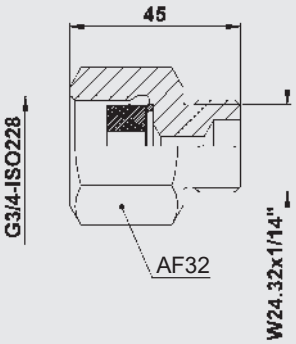
G 8 (part no. 2103425)



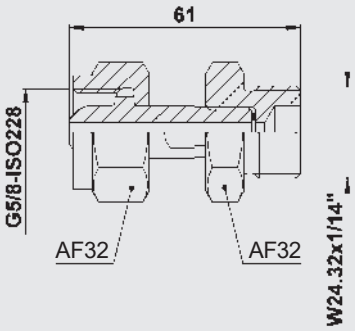
G 9 (part no. 241168)



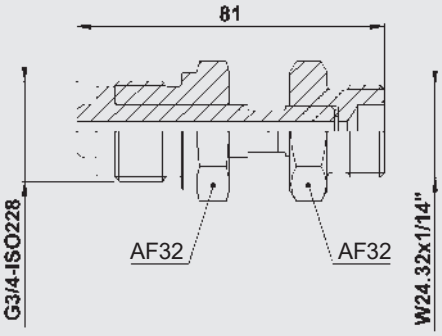
G 10 (part no. 2103427)



G 11 (part no. 3018678)



G 12 (part no. 3195556)



G 13 (part. no. 3787884)

4. ACCESSORIES

4.1. PROTECTIVE CASE

To protect the FPU from becoming contaminated or damaged, with foam insert and prefabricated recesses to hold all parts and any accessories (adapters, tools, etc.).

Different types of case are available, depending on customer requirements.

	Weight approx. [kg]		Outer dimensions [mm]
FPU-1 (basic version)	Without case	1.4	–
	With case	3	460x350x120
FPU-2	Without case	8.2	–
	With case	14.2	530x430x180

4.2. GAS SAFETY VALVE FOR FPU-1

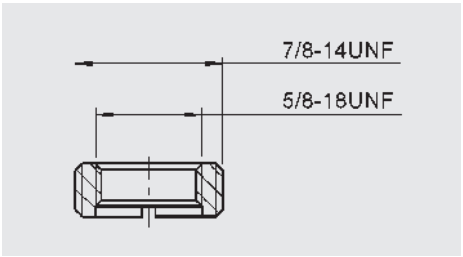
Provides protection by reducing the pressure in a controlled way if pressure exceeds the permitted level unexpectedly, see catalogue section:

- Safety equipment for hydraulic accumulators No. 3.552

4.3. D4 ADAPTER FOR FPU-1

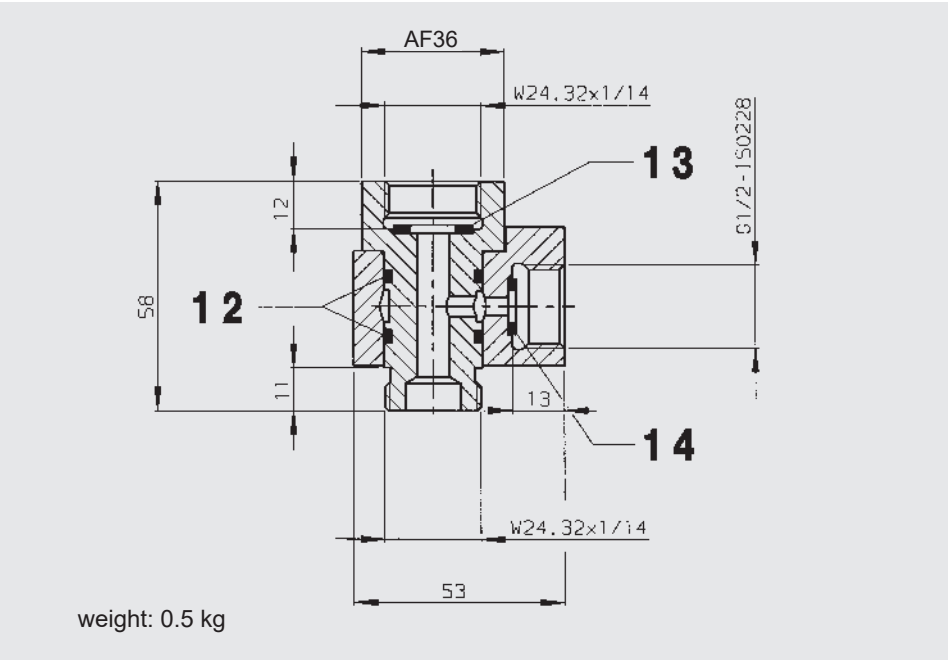
D adapter for bladder accumulator < 1 litre (see section 3.)

D4 = 5/8-18UNF (part no. 366374)



4.4. GSV6-10-CE INTERMEDIATE PIECE FOR FPU-1

Intermediate piece for installing the GSV 6 gas safety valve between the 200 bar nitrogen bottle and the FPU-1 Charging and Testing Unit.



weight: 0.5 kg

Description	Quantity	Item	Part no.
GSV6-10-CE intermediate piece	-	-	242558
Seal kit for intermediate piece consisting of:	-	-	2117287
O-ring 20x2.5x2	2	12	-
Seal ring 20x11.5x2	1	13	-
Seal ring 14x8.5x2	1	14	-

4.5. PRESSURE REDUCING VALVE

For adjusting the required pre-charge pressure between the nitrogen bottle and the accumulator.

4.5.1 **Pressure reducing valve for 200 bar nitrogen bottles**

Inlet: lock nut W24, 32x1/14-DIN477, Part 1

Outlet: external thread W24, 32x1/14-DIN 477, Part 1

Starting pressure [bar]	Back pressure [bar]	Part no.
200	20	635409
	100	635411
	170	635412

4.5.2 **Pressure reducing valve for 300 bar nitrogen bottles**

Inlet: lock nut W30x2-DIN 477, Part 5

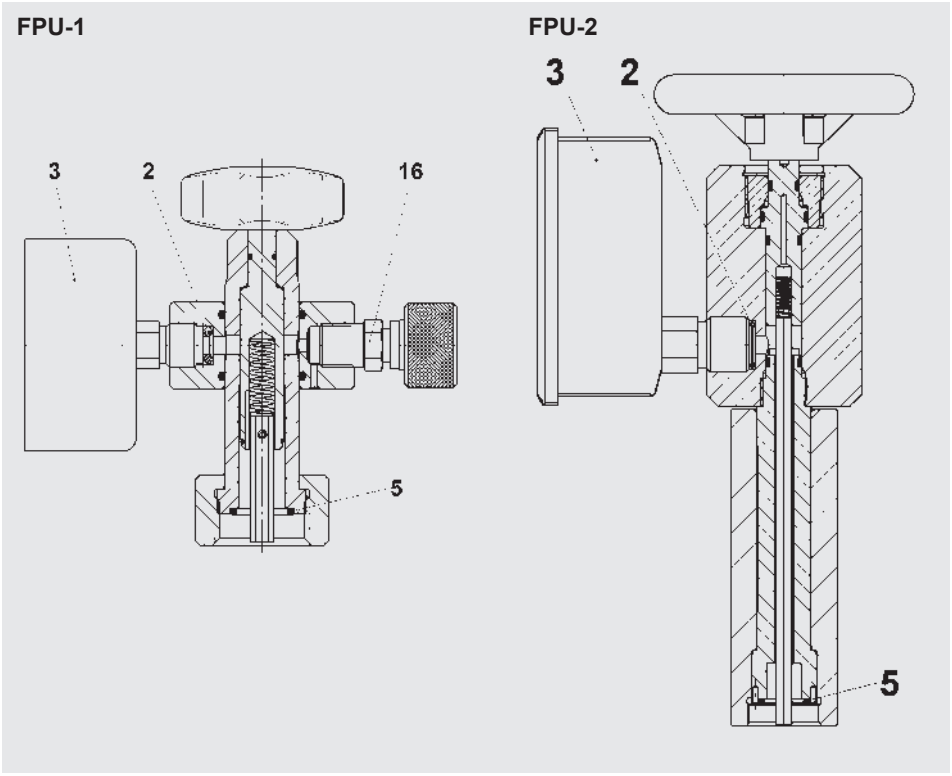
Outlet: external thread W24, 32x1/14-DIN 477, Part 1

Starting pressure [bar]	Back pressure [bar]	Part no.
300	20	6004020
	100	6004021
	170	6004022
	300*	6004023

* For back pressures >200 bar, the outlet has an external thread W30x2-DIN 477, Part 5

5. SPARE PARTS, ADAPTERS AND TOOLS

5.1. SPARE PARTS FOR FPU-1 AND FPU-2



Description	Item	FPU-1		FPU-2	
		Part no.	Quantity	Part no.	Quantity
Seal kit for FPU consisting of:		2117669	1	4295673	
Rhombic seal	2	–	1	–	1
O-ring 15x2	5	–	1	–	1
Seal ring	6	–	1	–	–
O-ring 11x2	7	–	1	–	–
O-ring 11x2.5	9	–	1	–	–
O-ring 5.7x1.9	10	–	1	–	–
Pressure gauge 0 - 10 bar	3	635139	1	–	
0 - 25 bar	3	635140	1		
0 - 100 bar	3	635141	1		
0 - 250 bar	3	635142	1		
0 - 400 bar	3	635143	1		
0 - 1000 bar	3	–		6167756	1
Release valve	16	3103471	1	–	

5.2. SPARE PARTS FOR ADAPTER

Description	Item	FPU-1, FPU-2	
		Part no.	Quantity
Seal kit for FPU adapter consisting of:	–	3269153	
O-ring 11x2	7	–	3
O-ring 9x2	8	–	3
Seal ring 9.3x13.3x1	11	–	3
Seal ring 27x32x2	12	–	1
O-ring 6x1.2	13	–	1
O-ring 19x2	14	–	1
Seal ring for adapter A9	15	–	1
Seal ring 6x13x2	50*	–	1

* Only suitable for A7 adapter up to May 2006

5.3. TOOLS FOR FPU-1

Designation	Part no.
Wrench 14x15	1011065
Allen key AF6	1005164
Torque wrench	3136470
Gas valve removal tool	616886

6. NOTE

The information in this brochure relates to the operating conditions and fields of application described.
For applications and/or operating conditions not described, please contact the relevant technical department.
Subject to technical modifications.

EN 3.501.31/04.21

Safety and shut-off block
SAF/DSV

1. DESCRIPTION

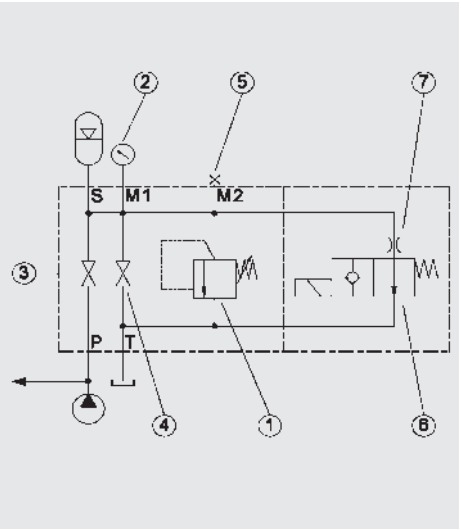
1.1. GENERAL

The HYDAC safety and shut-off block is a hydraulic accessory element that is used to protect against excess pressure on the fluid side and to shut-off and relieve hydraulic accumulators.
It takes into account the applicable safety regulations according to DIN EN ISO 4413 and the German Industrial Safety Regulation (BetrSichV).

The HYDAC pressure relief valve (DB12) is used in the SAF series. It is a direct-acting pressure relief valve in a poppet valve construction with excellent opening and closing characteristics. This version of the DB12 complies with the requirements of the European Pressure Equipment Directive (PED) with CE marking and is supplied with a declaration of conformity and operating instructions.

The operating instructions must be observed!
No. 5.169.B

1.1.1 Circuit diagram

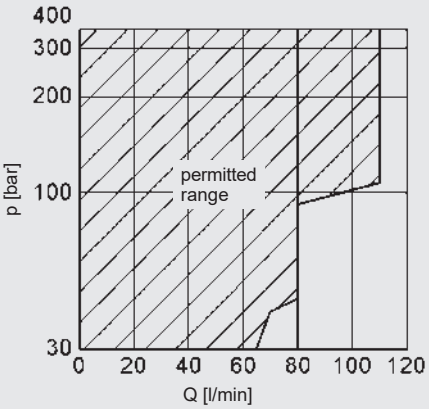


DB12 pressure relief valve
② M1 connection
(optional pressure gauge available)
ISO 228 - G 1/4 (SAF10, SAF8)
ISO 228 - G 1/2 (all others)
③ Shut-off valve
④ Pressure release valve
⑤ M2 connection (e.g. for p_0-Guard)
ISO 228 - G 1/4 (all sizes)

These devices are combined in a compact, space-saving HYDAC safety and shut-off block. The following devices are also available:

⑥ Solenoid-operated release valve
(optional for type SAF…E…)
⑦ Throttle
S Hydraulic accumulator connection
P Pump connection
T Tank connection

Application limits
DB12-CE p-Q graph, see ①



1.1.2 Product advantages

The compact combination of components considerably simplifies the connection of a consumer to the hydraulic system and provides the following benefits:

- Minimum of space, maintenance and piping required. Up to 10 fewer pipe fittings are necessary compared to individual piping.
- Considerable reduction in installation time.
- Connections for various accumulator designs and manufacturers are available – all imperial and metric thread types as well as manifold-mounted and weld nipple connections.
- Additional valves such as pilot-operated check valves, flow control valves and combined flow control and check valves can be fitted to system connection P.

1.2. DESIGN

The SAF safety and shut-off block consists of a valve block, an integrated HYDAC pressure relief valve, a main shut-off valve and a manually operated pressure release valve. The necessary pressure gauge connections are provided in addition to the tank connection.
In addition, an optional solenoid-operated 2-way directional valve allows automatic discharge of the accumulator or consumer and therefore of the hydraulic system in an emergency or for shut-down.

1.3. CONNECTIONS

The safety and shut-off block has the following connections:

S – Hydraulic accumulator connection

P – Pump connection
Connection of the SAF to the system

T – Tank connection
The piping leading to the tank must be installed separately.
This ensures that the flow can be channelled away to the tank unpressurised when the DB12 pressure relief valve is opened.

M1 – With optional pressure gauge
ISO 228 - G 1/4 (SAF10, SAF8)
ISO 228 - G 1/2 (all others)

M2 – E.g. for p_0-Guard
ISO 228 - G 1/4 (all sizes)

1.4. SPECIFICATIONS

1.4.1 Operating fluids

Mineral oil to DIN 51524
Part 1 and Part 2
(other fluids on request)

Viscosity range
min. 10 mm²/s
max. 380 mm²/s

Filtration
Max. permitted contamination level of the operating fluid to ISO 4406
Class 21/19/16 or SAE AS 4059 Class 11.
We therefore recommend a filter with a minimum retention rate of $ß_{20} \geq 100$.
The fitting of filters and regular replacement of the filters guarantees correct operation, reduces wear and extends the service life.

1.4.2 Permitted operating temperature

Standard design
-10 °C ... +80 °C
(ambient temperature for E type limited to -10 °C ... +60 °C)

Low-temperature version
-40 °C ... +80 °C

1.4.3 Max. operating pressure

400 bar

1.4.4 Model with solenoid-operated pressure release

Type
Solenoid-operated by means of pressure-tight, oil-immersed, single-stroke solenoids in accordance with VDE 0580. Actuating solenoid with male connector to DIN 43650, standard for general industrial applications, available for 24 V DC and 230 V AC.

Type of voltage
DC solenoid
When connected to AC voltage, the necessary DC voltage is produced by means of a bridge rectifier connector.

VOLTAGE TOLERANCE
±15 % of the nominal voltage

Nominal current
Dependent on the nominal voltage
24 V DC 0.80 A
230 V AC 0.11 A

Power consumption
p_{20} = 18 W

DUTY CYCLE
100 % DC = CO (continuous operation)

Switching time
This depends on the symbol, pressure at the individual ports and the flow rate

WSM06020Y:
on: 50 ms
off: 35 ms

WSM06020Z:
on: 35 ms
off: 50 ms

1.4.5 Notice

All work with HYDAC safety and shut-off blocks must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.

The operating instructions must be observed!
No. 3.551.BA

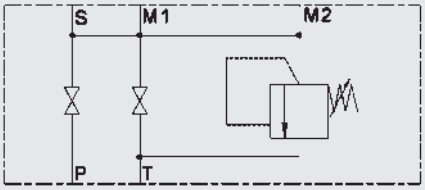
1.5. STANDARD DESIGNS

1.5.1 Model with manually operated pressure release

The basic model of the safety and shut-off block has a manually operated pressure release valve, code "M", and a direct-acting pressure relief valve.

Sizes: SAF10, SAF20, SAF32

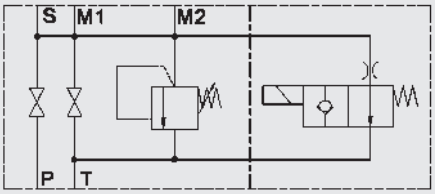


1.5.2 Model with solenoid-operated pressure release

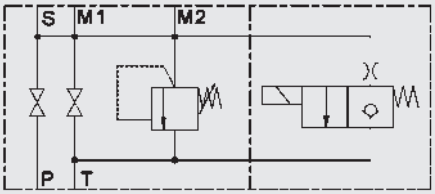
The E type safety and shut-off block has a solenoid-operated 2-way directional valve for automatic pressure release of the accumulator and the hydraulic system.

Sizes: SAF10, SAF20, SAF32

Normally open "Y"



Normally open "Z"



1.6. Δp-Q GRAPHS FOR SAF

Measured at:

v = 32 mm²/s

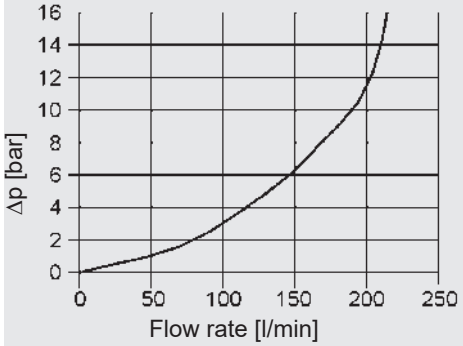
t_{oil} = 40 °C

Operating pressure = 400 bar

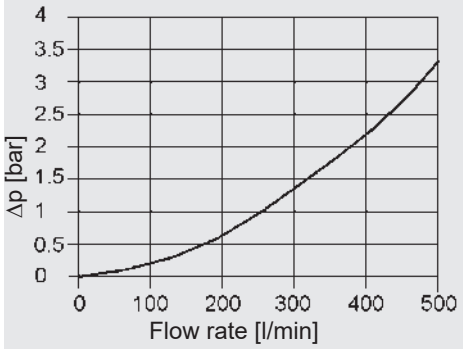
with DB12 pressure relief valve

1.6.1 Flow from the pump to the accumulator

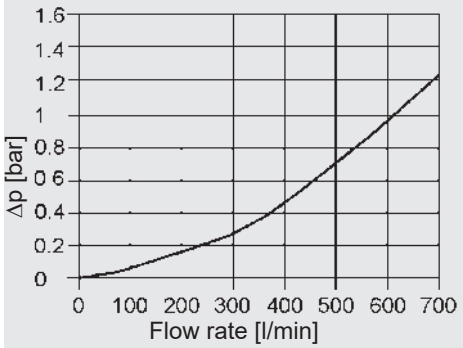
SAF10M/E



SAF20M/E



SAF32M/E; SAF32-3M/E



1.6.2 Flow from the accumulator via the pressure release valve to the tank

SAF10E

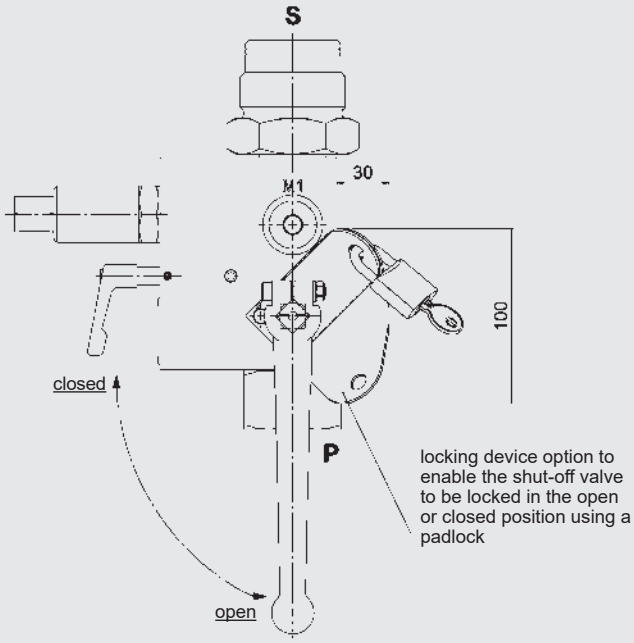
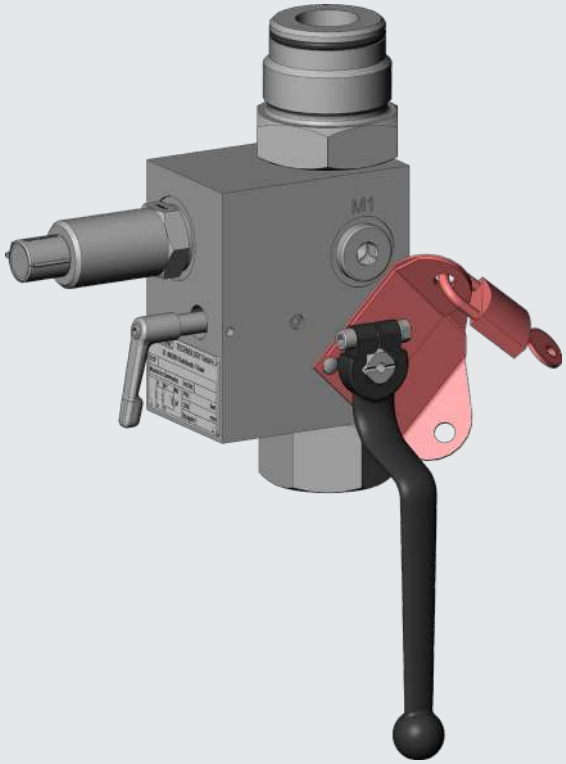
5. ADDITIONAL EQUIPMENT FOR SAFETY AND SHUT-OFF BLOCKS

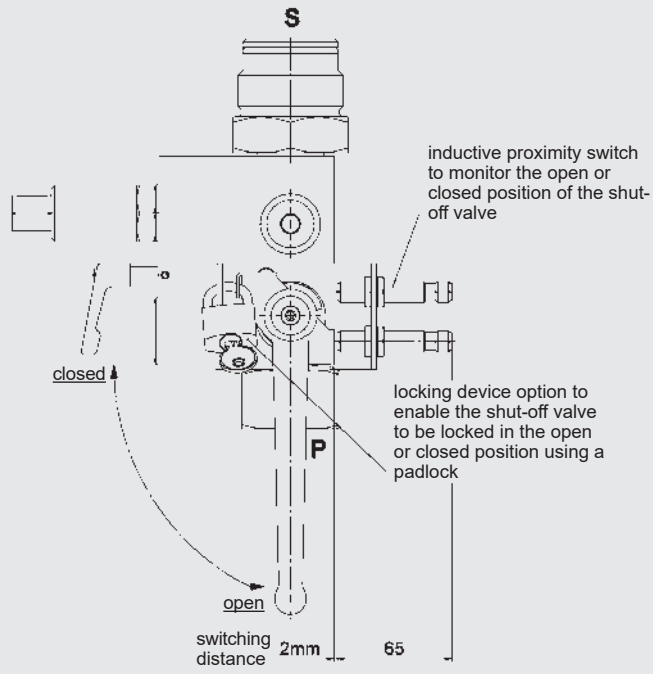
In safety and shut-off blocks, the position of the shut-off valve/the pressure release valve can be secured.
HYDAC supplies various additional devices for this (retrofit options, see section 8.):

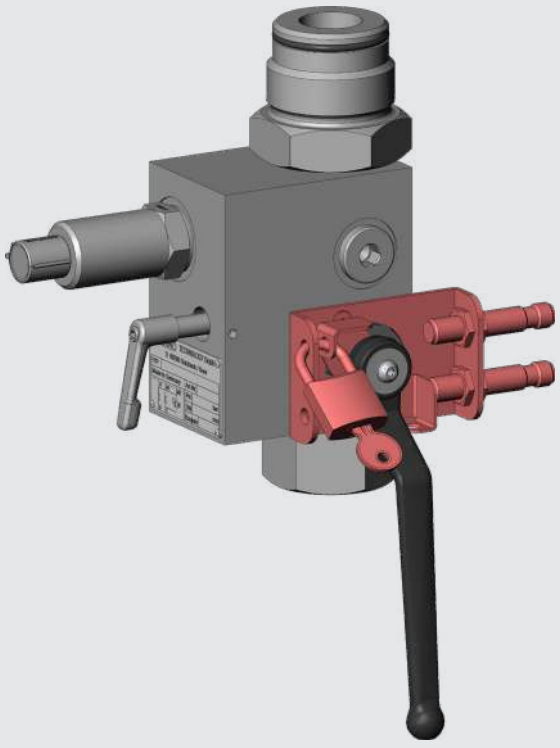
Additonal device L



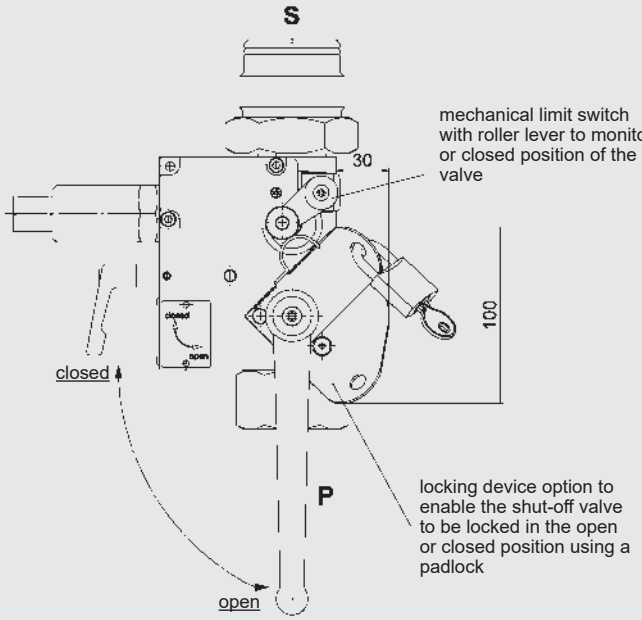


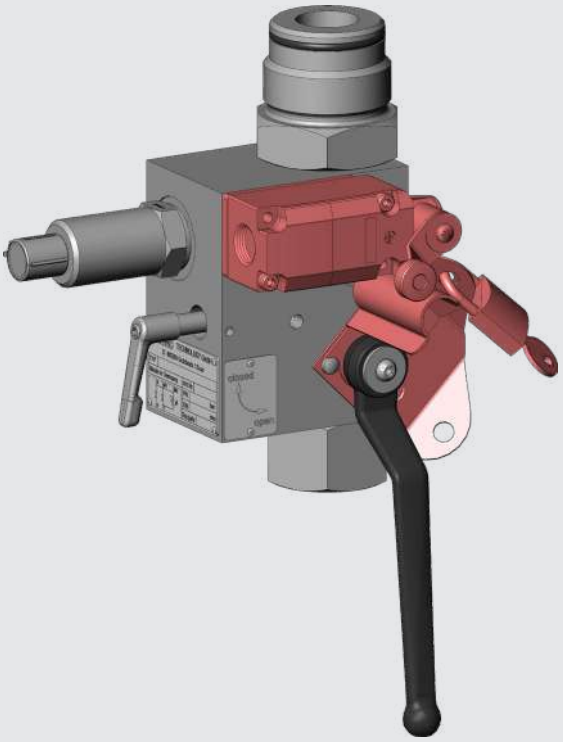
Additional device LPI



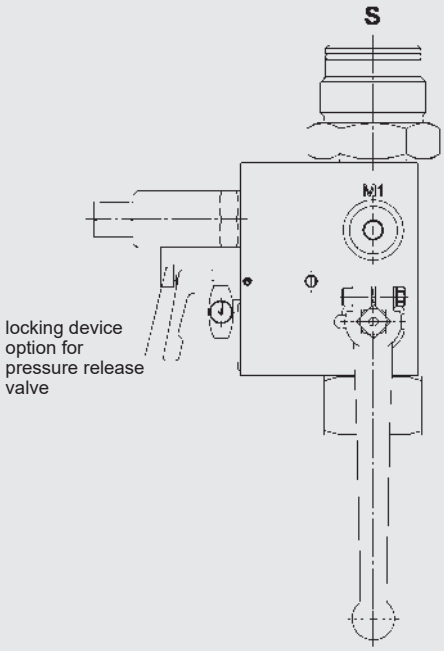


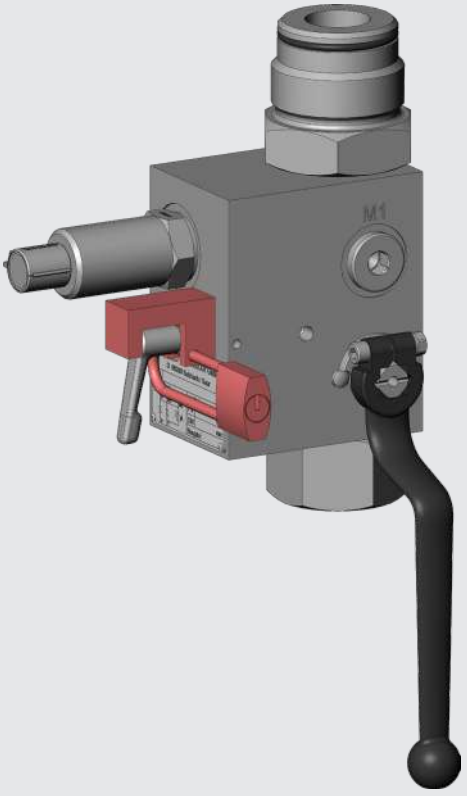
Additional device LPM





Additional device LS

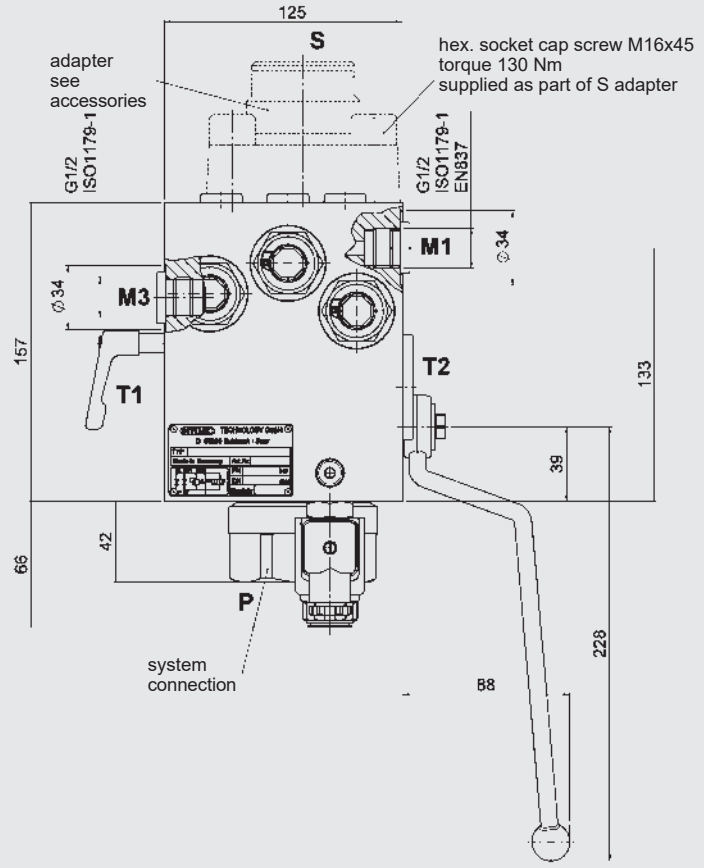


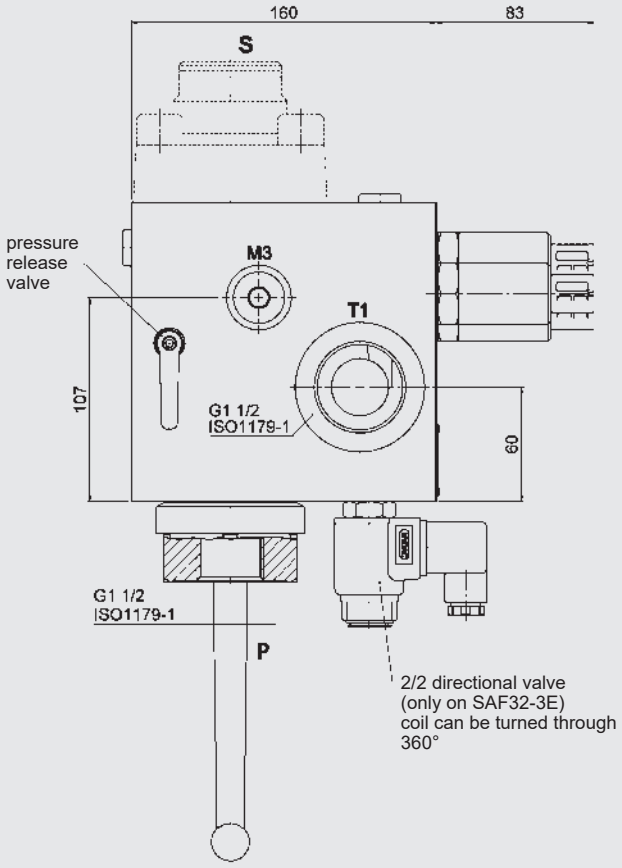


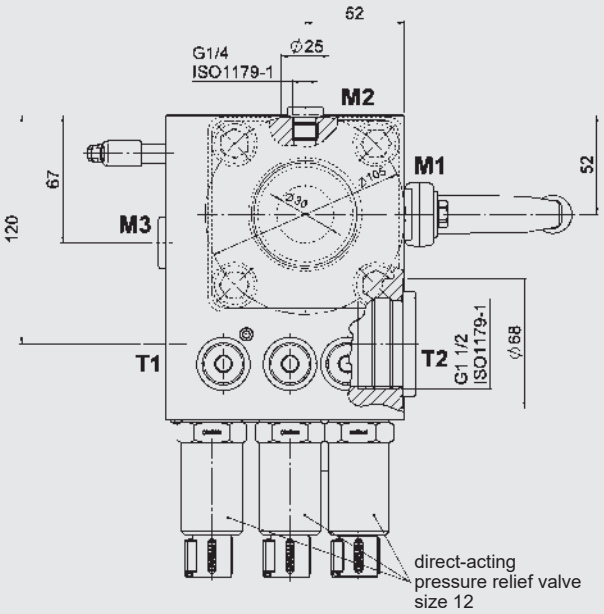
6. SPECIAL MODELS

6.1. TYPE SAF32-3M(E)

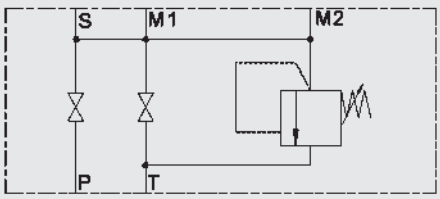
with 3 direct acting pressure relief valves size 12
(max. operating pressure 400 bar)



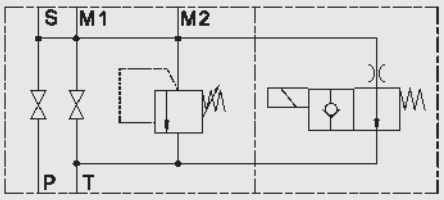




SAF32-3M



SAF32-3E

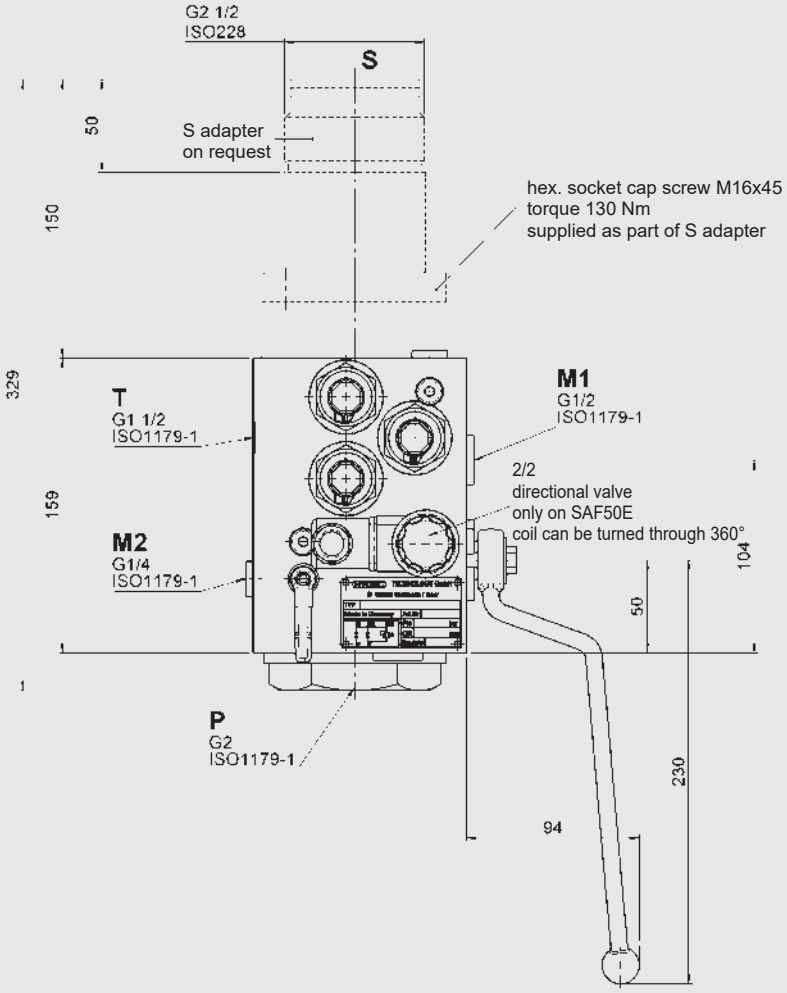


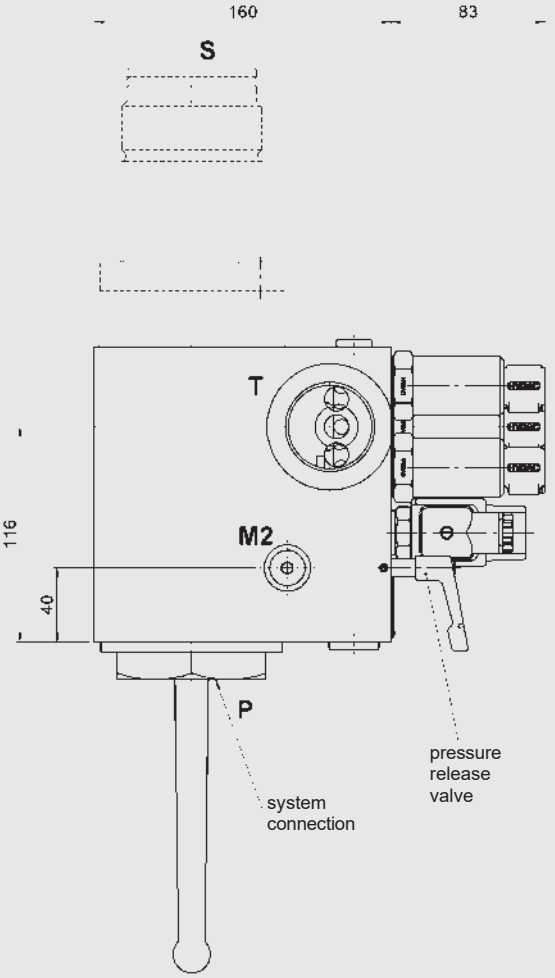
Type	Weight
SAF32-3M...	24 kg
SAF32-3E...	25 kg

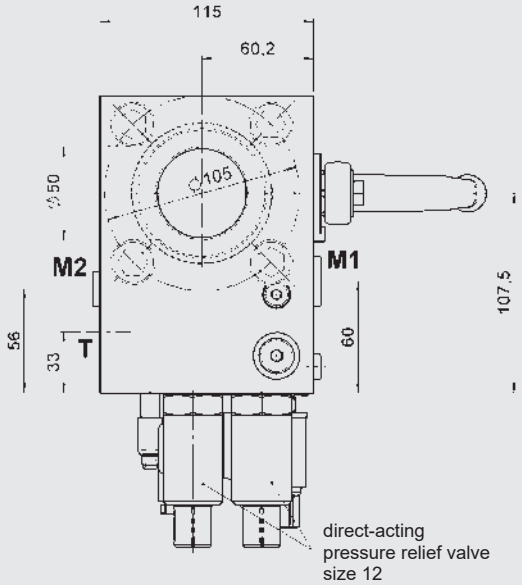
6.2. TYPE SAF50M(E)

for high flow rates
with 3-direct acting pressure relief valves size 12

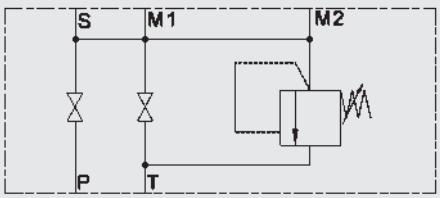
Max. operating pressure
Type M: 400 bar
Type E: 350 bar



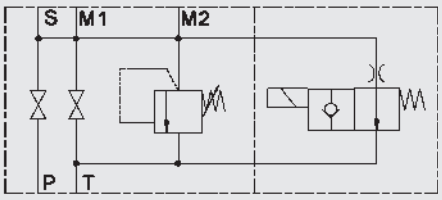




SAF50M



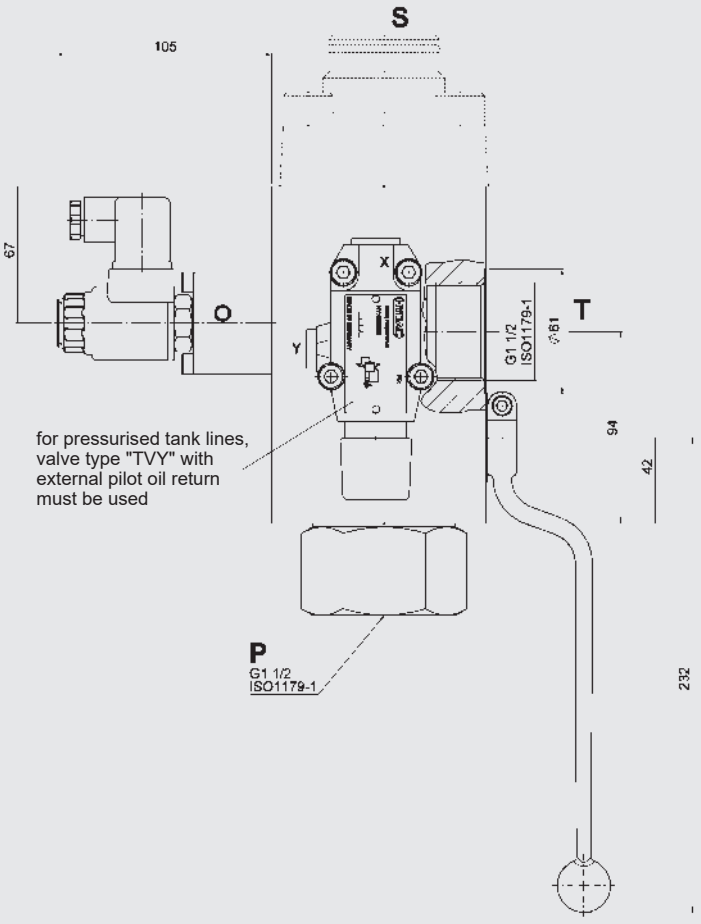
SAF50E

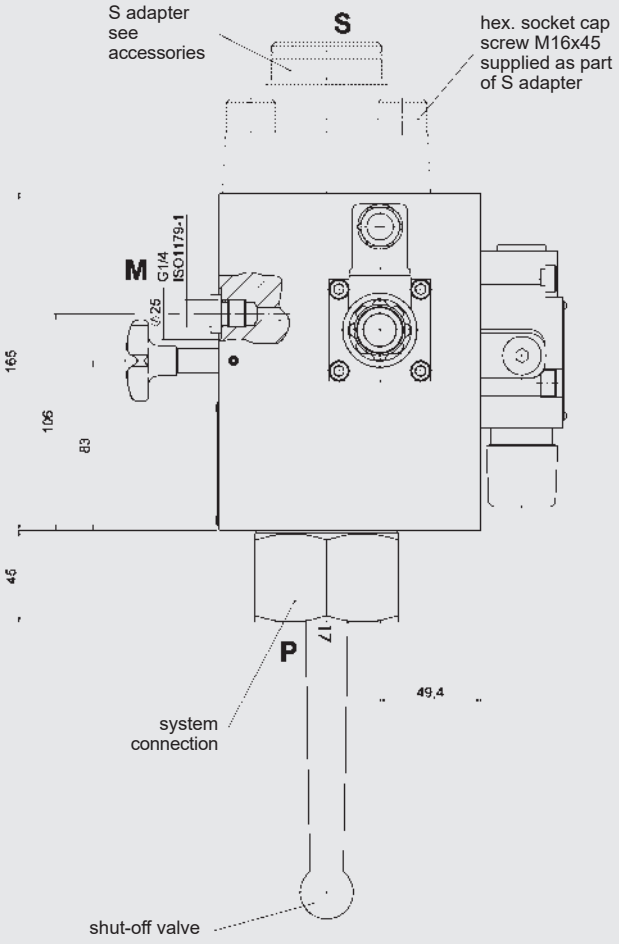


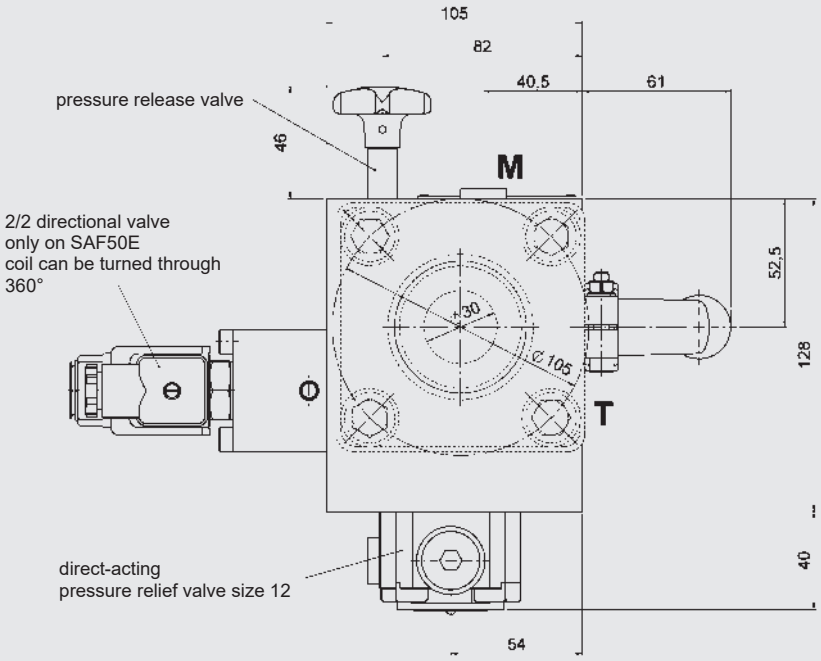
Type	Weight
SAF50M...	25 kg
SAF50E...	26 kg

6.3. TYPE SA32M(E)29

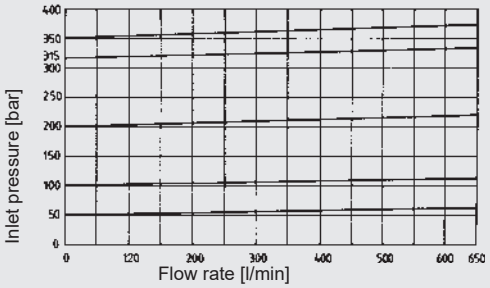
with pilot-operated pressure relief valve (Q_{max} = 600 l/min)
(max. operating pressure 330 bar)



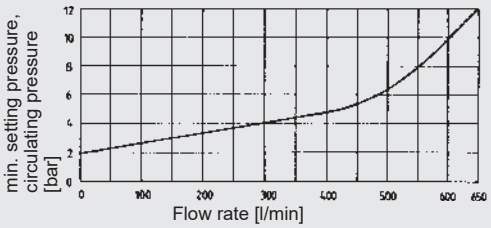




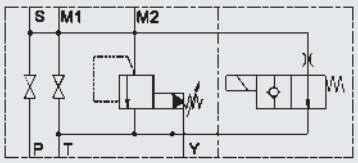
Pilot-operated
pressure relief valve size 32



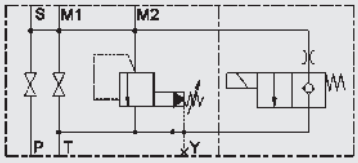
Lowest setting pressure [bar]



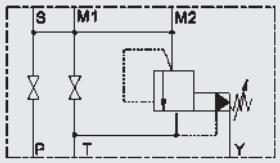
SA32E29TVY



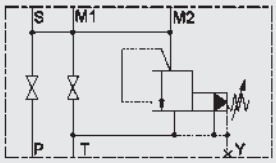
SA32E29TV



SA32M29TVY



SA32M29TV



The safety and shut-off block SA32M(E)29 is equipped with a pilot-operated pressure relief valve size 32 for high flow rates up to 600 l/min.

The E type of the safety and shut-off block has a solenoid-operated 2-way directional valve for automatic pressure release of the accumulator and the hydraulic system in an emergency or for shut-down.

For unpressurised tank lines, valve type "TV" must be used
(with internal pilot oil return to tank).

For pressurised tank lines, valve type "TVY" is recommended
(with external pilot oil return to tank).

Two different models of the 2-way directional valve are available:

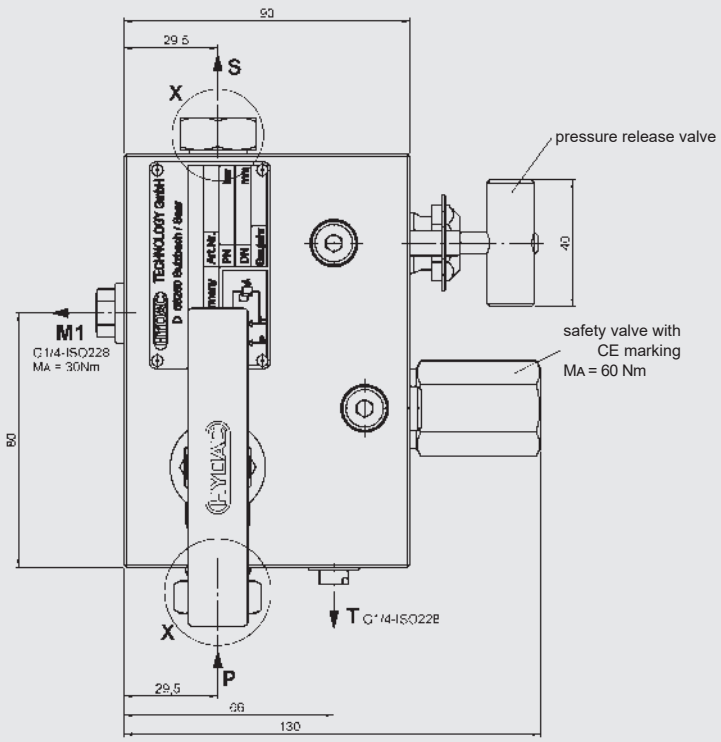
– WSM06020Y (normally open)

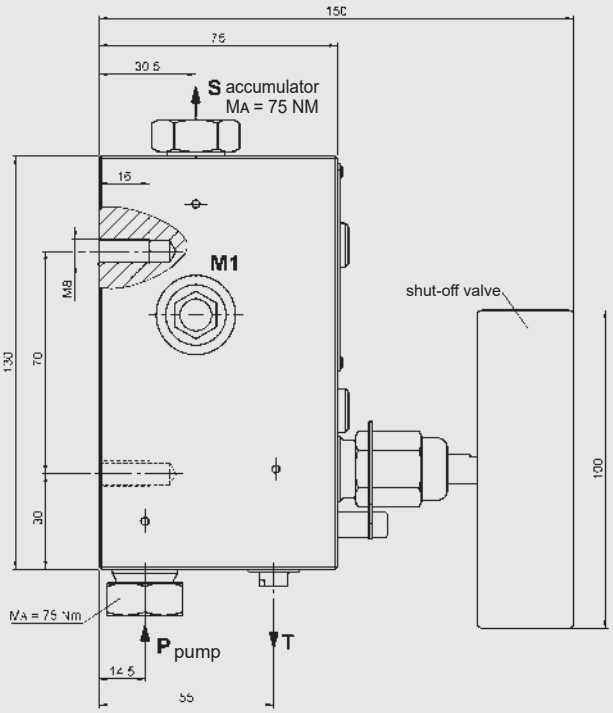
– WSM06020Z (normally closed)

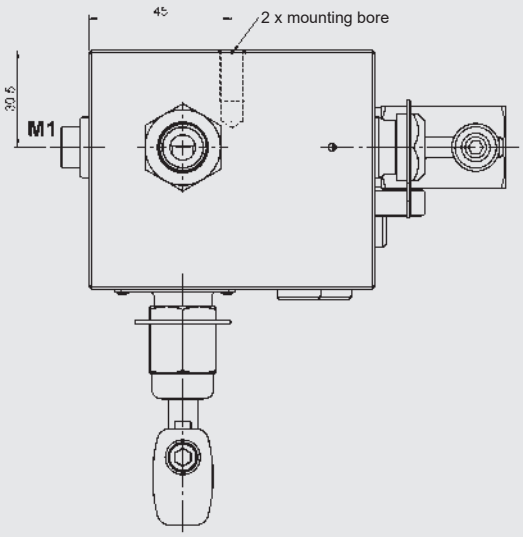
Type	Weight
SA32M29...	22.5 kg
SA32E29...	23.5 kg

6.4. TYPE SAF8M

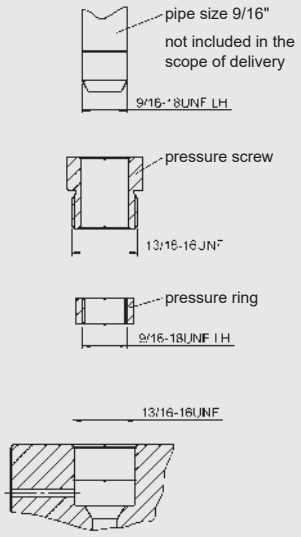
For pressures of 400 bar and above in stainless steel with high-pressure ports
(max. operating pressure 800 bar)

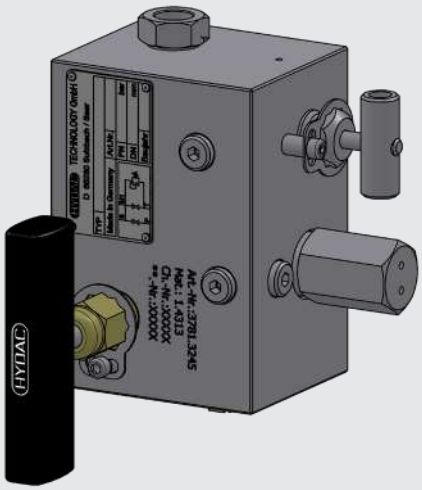


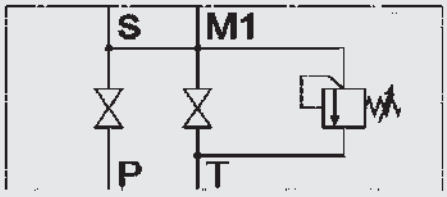




X (1:1)







Type	Weight
SAF8M	7.5 kg

6.5. SAFETY AND SHUT-OFF BLOCK WITH 2-WAY CARTRIDGE VALVE (LOGIC ELEMENT)

This safety and shut-off block consists of a valve block, an integrated pressure relief valve and a solenoid-operated 2-way cartridge valve which replaces the main shut-off valve.

Advantages:
In addition to its compact design, this model is capable of rapid switching to control the fluid flow.

6.5.1 Function when using 4/2 directional valve

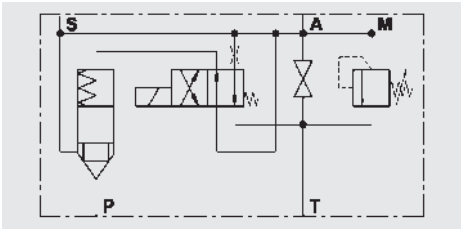
When the 4/2 directional valve is in the switching position shown (open when de-energised), the spring chamber of the logic element is pressurised via the accumulator pressure; the path from P to S is blocked and the hydraulic accumulator is automatically shut off from the system. By connecting the accumulator via the orifice in the pilot valve to the tank, it will slowly discharge.

When the 4/2 directional poppet valve is in the discharge position (energised) the spring chamber of the logic element is discharged, the path from P to S is open and the accumulator is charged.

Specifications:

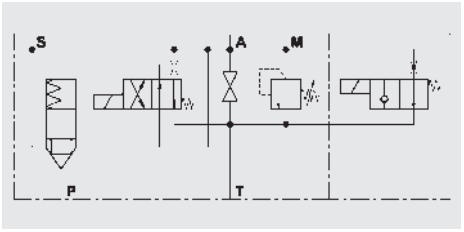
Type	Nominal size	Max. operating pressure	Pressure relief valve [1]
SA20A50T...	DN20	400 bar	DB12 (2)
SA32A50T...	DN30	400 bar	DB12 (3)

[1] Number of pressure relief valves



Type	Nominal size	Max. operating pressure	Pressure relief valve [1]
SA20E50T...	DN20	400 bar	DB12 (2)
SA32E50T...	DN30	400 bar	DB12 (3)

[1] Number of pressure relief valves



6.5.2 Function when using 3/2 directional poppet valve

When the 3/2 directional poppet valve is in the switching position shown (open when de-energised), the spring chamber of the logic element is pressurised via the system pressure; the path from P to S is blocked and the hydraulic accumulator is shut off from the system. When the 3/2 directional poppet valve is in the discharge position (energised) the spring chamber of the logic element is discharged, the path from P to S is open and the hydraulic accumulator is charged.

If the pump breaks down or if it is switched off, the 3/2 directional poppet valve reverts to the "open when de-energised" position; the accumulator pressure shuts off the logic element via the shuttle change-over valve and shuts off the hydraulic accumulator from the system.

Specifications:

Type	Nominal size	Max. operating pressure	Pressure relief valve [1]

7. DESCRIPTION OF DSV10

7.1. GENERAL

DSV10 as a low cost alternative to SAF10

The three-way DSV10 safety block is used to isolate and discharge hydraulic accumulators and consumers. It complies with the relevant safety standards in accordance with DIN EN 4413 and the German Industrial Safety Regulation BetrSichV.
The HYDAC DB12 pressure relief valve is used with the DSV series. It is a direct-acting pressure relief valve in a poppet valve design with excellent opening and closing characteristics.
This version of the DB12 complies with the requirements of the European Pressure Equipment Directive (PED) with CE marking.
There are four different versions:

- DSV10M
  manual discharge, standard L-ball
- DSV10M-T-ball
  manual discharge, T-ball
- DSV10EY
  manual/solenoid discharge, normally open
- DSV10EZ
  manual/solenoid discharge, normally closed

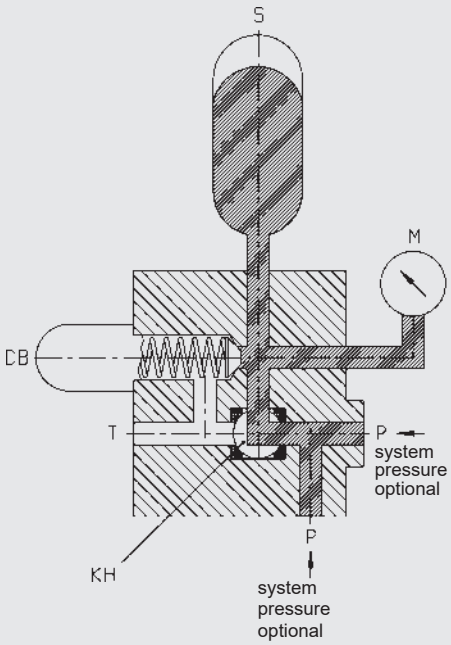
The essential difference compared to the SAF10 lies in the shut-off and discharge function of the DSV10. On request we can supply other models to cover almost all applications, e.g. for aggressive media.

On request we can supply test certificates to EN 10204 and quality test certificates to DIN 55350, Part 18.

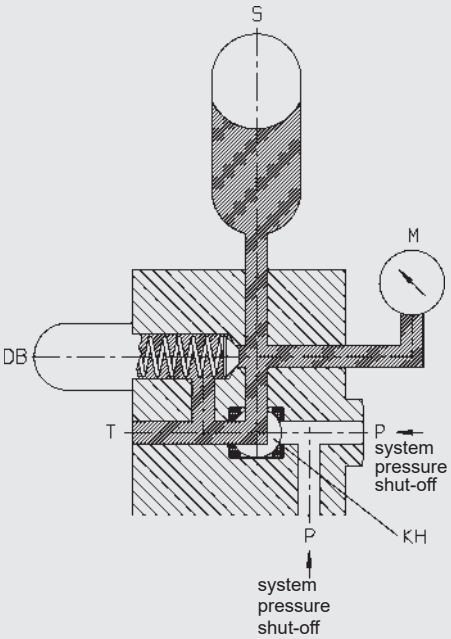
7.2. DESIGN

The DSV three-way safety block consists of a valve block with an integrated HYDAC pressure relief valve and the shut-off valve. It has connections for the pump, pressure gauge, tank and hydraulic accumulator. In addition, an optional solenoid-operated 2-way directional valve allows automatic discharge of the hydraulic accumulator or consumer.

Accumulator operation



Shutting off the system pressure and simultaneously discharging the hydraulic accumulator



P – Pump connection
S – Hydraulic accumulator
KH – Change-over ball valve
DB – Pressure relief valve
M – Pressure gauge connection
T – Tank connection

The DSV10 can be used as a cost-effective alternative to the SAF10. Unlike the SAF10, the DSV10 shuts off when discharging simultaneously to the tank.

7.3. CONNECTIONS

The DSV has the following connections:

S – Hydraulic accumulator connection (M33x2 DIN 3852 Part 3)
P – Pipe connection (ISO 228 – G 3/8 and G 1/2)
T – Tank connection (ISO 228 – G 1/2)
M – Pressure gauge connection (ISO 228 – G 1/4)

7.4. FUNCTION

When the accumulator is in operation the change-over ball valve connects the pump connection with the hydraulic accumulator. At the same time, the hydraulic accumulator is monitored for pressure via the built-in pressure relief valve.
By switching over the ball valve, the pump connection is shut off leakage-free on the inlet side and the hydraulic accumulator is discharged simultaneously to the tank.

During switching, all three ports (P, S and T) are momentarily interconnected (negative switching overlap). Automatic relief can be achieved by fitting a solenoid-operated 2/2 directional valve (e.g. in the event of a power failure or shut-down).

7.5. NOTES

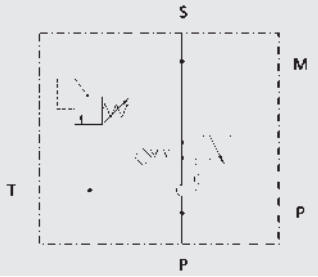
Ball valves are not designed to be used as flow control valves; therefore they should always be either fully open or fully closed to avoid damaging the sealing cups.

To ensure correct functioning, pressure and temperature specifications must be observed.

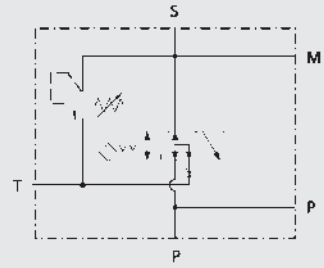
7.6. SPECIFICATIONS

7.6.1 **Symbols**

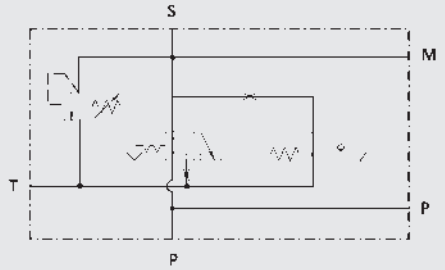
DSV10M



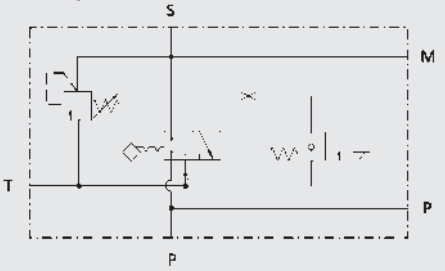
DSV10M T-ball



DSV10EY



DSV10EZ



7.6.2 **Design**

Ball valve isolating device

Pressure relief valve is a direct-acting poppet seat valve

Poppet valve is pilot-operated

7.6.3 **Materials**

Housing and locking screw in steel, surface protection: phosphate-plated. Ball in steel, hard-chromed, pressure relief valve and poppet valve in high tensile steel, closing element in hardened and ground steel, wear-resistant, surface protection: phosphate-plated, ball seal in high quality synthetic material (POM), soft seals in Perbunan (NBR), cranked handle AF09 in red anodised aluminium.

7.6.4 **Installation**

No orientation restrictions

7.6.5 **Operating fluids**

Mineral oil to DIN 51524 Part 1 and Part 2 (other fluids on request)

Viscosity range:

min. 10 mm²/s
max. 380 mm²/s

Filtration:

Max. permitted contamination level of the operating fluid to ISO 4406 Class 21/19/16 or SAE AS 4059 Class 11.
We therefore recommend a filter with a minimum retention rate of $\beta_{20} \geq 100$. The fitting of filters and the regular replacement of filter elements guarantees correct operation, reduces wear and increases the service life.

7.6.6 **Permitted operating temperature**

-10 °C ... +80 °C

(ambient temperature for E type limited to -10 °C ... +60 °C)

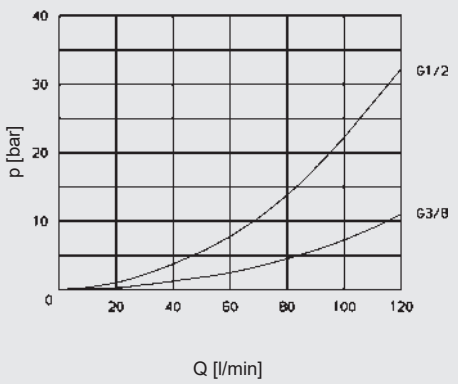
7.6.7 **Maximum operating pressure**

350 bar

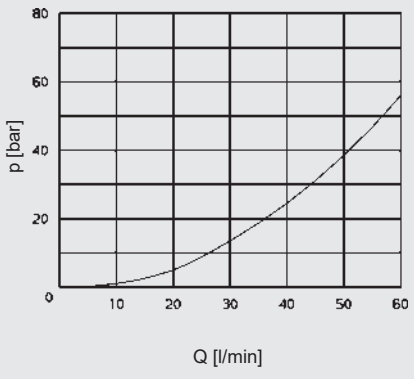
7.6.8 **Δp - Q characteristic curve**

Measured at
t_{oil} = 50 °C
ν = 30 mm²/s

Flow rate from P to S



Flow rate from S to T



7.6.9 **Model with solenoid-operated pressure release**

Type

Solenoid-operated by means of pressure-tight, oil-immersed, single-stroke solenoids in accordance with VDE 0580. Actuating solenoid with male connector to DIN 43650, standard for general industrial applications, available for 24 V DC and 230 V AC.

Type of voltage

DC solenoid:
When connected to AC voltage, the necessary DC voltage is produced by means of a bridge rectifier connector.

Voltage tolerance

±15 % of the nominal voltage

Nominal current

dependent on the nominal voltage

24 V DC 0.80 A

230 V AC 0.11 A

Power consumption

p_{20} = 18 W

Duty cycle

100 % (continuous operation)

Switching time

Depending on symbol, pressure across the individual ports and flow rate.

WSM06020Y:
on: 50 ms
off: 35 ms

WSM06020Z:
on: 35 ms
off: 50 ms

7.7. SPARE PARTS

Please see brochure:

- 3-way safety block DSV No. 5.251

7.8. MODEL CODE FOR DSV10

(also order example)

DSV – 10 – EY – 4 . 1 / 1 / X / T 210 – G 24 – Z4 S13

3-way safety block

Size
10

Discharge
M = manual discharge
EY = solenoid-operated and manual discharge – normally open
EZ = solenoid-operated and manual discharge – normally closed

Type of pressure relief valve
4 = DB12

With/without fitted pressure relief valve
1 = with pressure relief valve
0 = without pressure relief valve

Accumulator connection
1 = M33x2

Series
(specified by manufacturer)

Setting of pressure relief valve
T = pressure setting with TÜV
V = adjustable using tool
F = preset by manufacturer
x = model without relief valve cartridge

Opening pressure setting
e.g. 210 bar opening pressure
xxx = model without relief valve cartridge

Pressure setting range
DB12 – 150 bar
DB12 – 250 bar
DB12 – 350 bar

Type of voltage for solenoid
G = DC voltage
W = AC voltage

Nominal voltage for solenoid
24 = 24 V for type G voltage (DC)
230 = 230 V for type W voltage (AC)

Type of connection for solenoid
Z4 = connector to DIN 43650 - AF2 - PG11

Additional information
S13 = S13 adapter to hydraulic accumulator (see section 8.)

370754	Adapter G1/4A-G1/2	

8.5. ADDITIONAL DEVICES FOR RETROFITTING

HYDAC supplies the following additional devices for retrofitting to prevent accidental alteration of the position of the shut-off valve or the pressure release valve on the SAF block. For mounting onto the SAF, see section 5. Additional equipment for safety and shut-off blocks.

8.5.1 **Lockable main shut-off valve (locking device) - L**

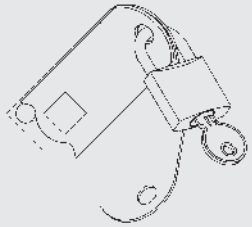

Fig. 1

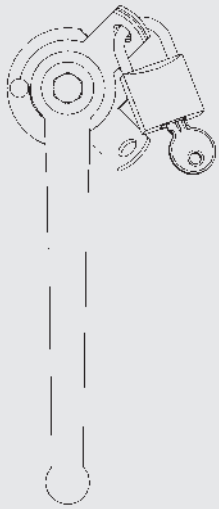

Fig. 2

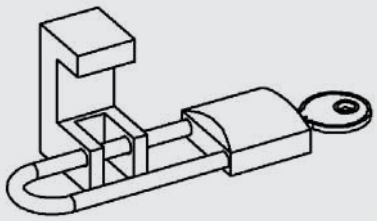
Part no.	Designation	Consisting of:	Fig.
4334727	Lockable main shut-off valve for SAF10	– Plates – Padlock	1
4334730	Lockable main shut-off valve for SAF20	– Plates – Padlock	
4334731	Lockable main shut-off valve for SAF32	– Plates – Padlock – Switching handle – Screw	2

8.5.2 **Lockable pressure release valve – LS**



Part no.	Designation	Consisting of:
3580490	Spindle lock SAF	– Spindle lock SAF – Padlock

8.6. ACCUMULATOR CHARGING VALVE

HYDAC accumulator charging valves control the charging of the accumulator within an adjustable switching range. By combining the charging valve with an accumulator, pumps and motors on oil-hydraulic systems with fluctuating flow requirements can be sized smaller. This saves costs and energy - thus preventing unnecessary heat generation.

For further information and technical specifications, see catalogue section:

- DLHSD DLHSR Accumulator charging valve
  No. 5.190.1

9. NOTE

The information in this brochure relates to the operating conditions and fields of application described.

For applications and/or operating conditions not described, please contact the relevant technical department.

Subject to technical modifications.

Safety equipment for hydraulic accumulators

1. DESCRIPTION

1.1. GENERAL

Hydraulic accumulators are pressure equipment, as defined by the European Pressure Equipment Directive (PED), and as such their manufacture is subject to the statutory regulations.

For safety in the workplace, system manufacturers and operators must draw up risk assessments for the particular site. These must take possible risks at the installation site into account as well as risks in combination with external factors.

Fundamental risks affecting hydraulic accumulators are:

- Excessive pressure
- Temperature increase (e.g. in the event of an external fire)

HYDAC provides the appropriate safety equipment to protect hydraulic accumulators from the maximum permitted operating pressure PS being exceeded on the gas and fluid side; see also catalogue section:

- HYDAC Accumulator Technology No. 3.000

When selecting safety equipment, consideration must be given to the material (elastomers and housing material) in terms of the material compatibility with the application.

The response pressure of safety equipment must **not** exceed the max. permitted operating pressure PS of a hydraulic accumulator.

1.2. NOTICE

All work with HYDAC safety devices must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.

The following operating instructions must be observed!

- Operating instructions GSV/GMP No. 3.504.BA
- Operating instructions GSB No. 3.505.BA

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

- HYDAC Accumulator Technology No. 3.000

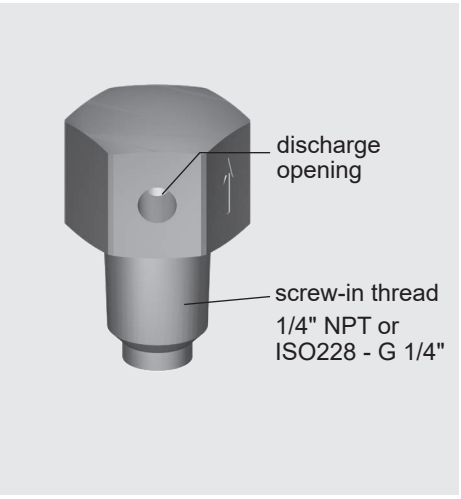
2. PROTECTION ON THE GAS SIDE

2.1. BURST DISC

2.1.1 Design



2.1.2 Function

If the pressure exceeds the permitted level, the burst disc is destroyed, permanently opening the port. This reduces the gas pressure by discharging the nitrogen completely.

Burst discs are designed for different response pressures and are supplied with a declaration of conformity.

Burst discs are made either entirely of stainless steel, or from an alloy based on stainless steel and nickel.

2.1.3 **Standard types**

Burst disc, welded, with declaration of conformity to PED
DN5

Designation	Burst pressure ±10 % at 50 °C	Part no.

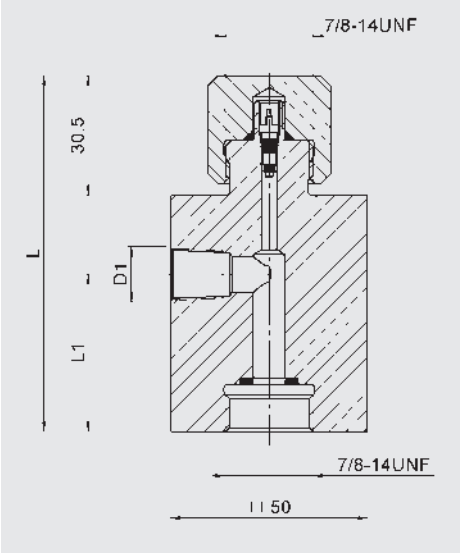
400	3706

Burst disc, clamped, with declaration of conformity to ASME VIII,
Div. 1 and VD stamp
DN 15, 1/2" NPT
on request

2.1.4 **Adapter for bladder accumulators**

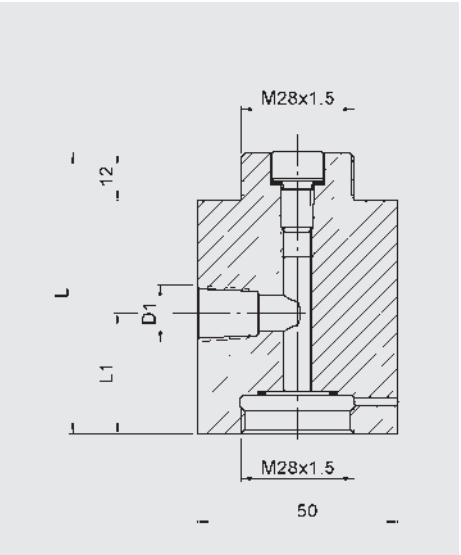
To protect standard and low pressure bladder accumulators, the adapter shown below must be ordered with the burst disc:



L [mm]	L1 [mm]	D1	Carbon steel	Stainless steel
90.5	40	1/4" NPT	366694	–
81.5	30	1/4" NPT	–	3117711
90.5	40	ISO 228 G 1/4"	364802	–
81.5	30	ISO 228 G 1/4"	–	3521154

2.1.5 **Adapter for piston and diaphragm accumulators**

To protect piston and diaphragm accumulators, the adapter shown below must be ordered with the burst disc:



L [mm]	L1 [mm]	D1	Carbon steel	Stainless steel
70	30	1/4" NPT	3344645	–
		1/4" NPT	–	4329253
		ISO 228 G 1/4"	4286781	–
		ISO 228 G 1/4"	–	3564669

2.2. TEMPERATURE FUSE

HYDAC offers two different kinds of temperature fuse. In addition to the temperature fuse in carbon steel and stainless steel, which is suitable for bladder accumulators, HYDAC offers a type GMP6 temperature fuse, which is approved according to the European Pressure Equipment Directive (PED). It is made of stainless steel and has a CE marking.

2.2.1 **Function**

Temperature fuses are "devices with a safety function" and are used to release the gas pressure by discharging the nitrogen completely when an increase in temperature reaches unacceptable levels (e.g. in the case of fire).

2.2.2 **Design/technical data/standard models**

Type	Temperature fuse		GMP6 temperature fuse	
Design				
Permitted operating pressure	≤ 450 bar		50 … 420 bar	
Temperature range	-10 °C ... +80 °C		-40 °C ... +120 °C	
Melting temperature	Between +160 °C and +170 °C		Between +160 °C and +170 °C	
CE marking	Not available		Available	
Standard types	**363501***	Temperature fuse 7/8-14UNF	3517438	GMP6-10-CE1637...
	3094166*	Temperature fuse 7/8-14UNF with eye bolt (for crane hook)	3521196	GMP6-10-CE1637... with adapter for bladder accumulators
			3584817	GMP6-10-CE1637... with adapter for piston and diaphragm accumulators

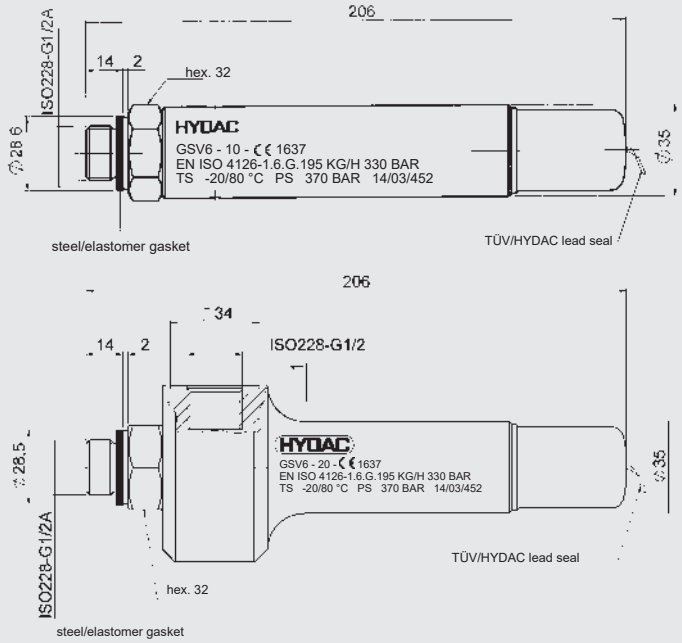
2.2.3 **Installation instructions**

See section 1.2.

Type	Temperature fuse	GMP6 temperature fuse
	Simple to retrofit (using the example of a bladder accumulator) by replacing the sealing cap with the temperature fuse.	Simple to retrofit (using the example of a bladder accumulator) by replacing the sealing cap with the GMP6 temperature fuse with adapter.
Bladder accumulator without temperature fuse		
Temperature fuse or GMP6 temperature fuse and adapter		

2.3. GAS SAFETY VALVE

2.3.1 Design and dimensions



2.3.2 Function

The gas safety valve protects the hydraulic accumulator by reducing the pressure in a controlled way **if pressure exceeds the permitted level unexpectedly** (regular triggering of the GSV6 can lead to leakage at the valve). It is pre-set on the pressure side and lead-sealed by the authorised representative. It is also supplied with a declaration of conformity and a type approval.

2.3.3 Model code

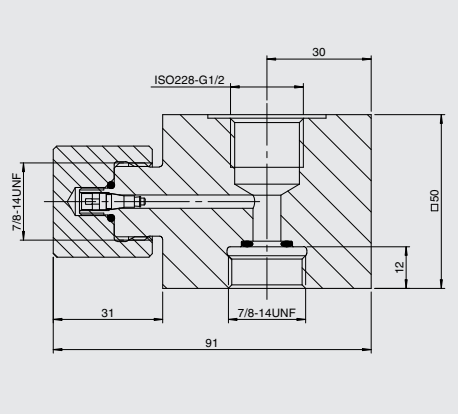
2.3.7 Adapter for bladder accumulators

To protect standard and low pressure bladder accumulators, the adapter shown below must be ordered with the GSV6 gas safety valve.

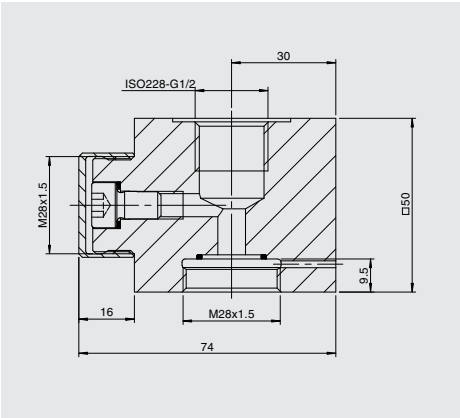


Designation	Part no.
Adapter assembly for bladder accumulators	2103381

Others on request

2.3.8 Adapter for piston and diaphragm accumulators

To protect piston and diaphragm accumulators, the adapter shown below must be ordered with the GSV6 gas safety valve:

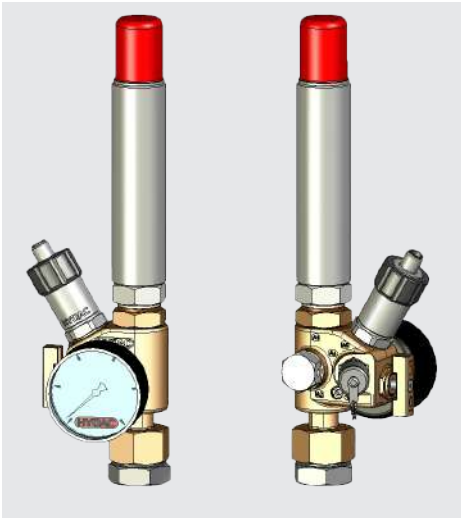


Designation	Part no.
Adapter assembly for piston and diaphragm accumulators	3423339

Others on request

2.4. GAS SAFETY BLOCK

2.4.1 Design



The GSB450 gas safety block consists of a brass block (other materials on request) with an integrated vent valve and shut-off valve and connections for:

- Pressure gauge
- Gas safety valve (GSV6)
- Gas charging valve (e.g. Minimess)
- Pressure transmitter or pressure switch
- Burst disc or temperature fuse

The gas safety valve connection is designed as a check valve. Therefore, the valve can be changed even if the system is pressurised.

2.4.2 Function

The GSB450 is an adapter block which is mounted on a hydraulic accumulator on the gas side and which can be fitted with various pressure devices, charging equipment, safety valves and other safety components.

2.4.3 Advantages

- Compact design
- Flexible connection options
- Variable indication options: bar, MPa or psi, analogue or digital (optional)
- The direction that the pressure indicator is facing can be individually adjusted
- Accumulator can be charged with nitrogen, directly via Minimess valve
- Pre-charge pressure can be checked without FPU-1

2.4.4 Model code

(also order example)

Medium
Nitrogen (N_2)

Permitted operating temperature
-20 °C ... +80 °C

Max. operating pressure
400 bar / 5800 psi

Accumulator connection
Bladder accumulator:
7/8-14UNF with adapter

For bladder accumulators, the appropriate adapter is supplied. All other connections are sealed with locking screws.

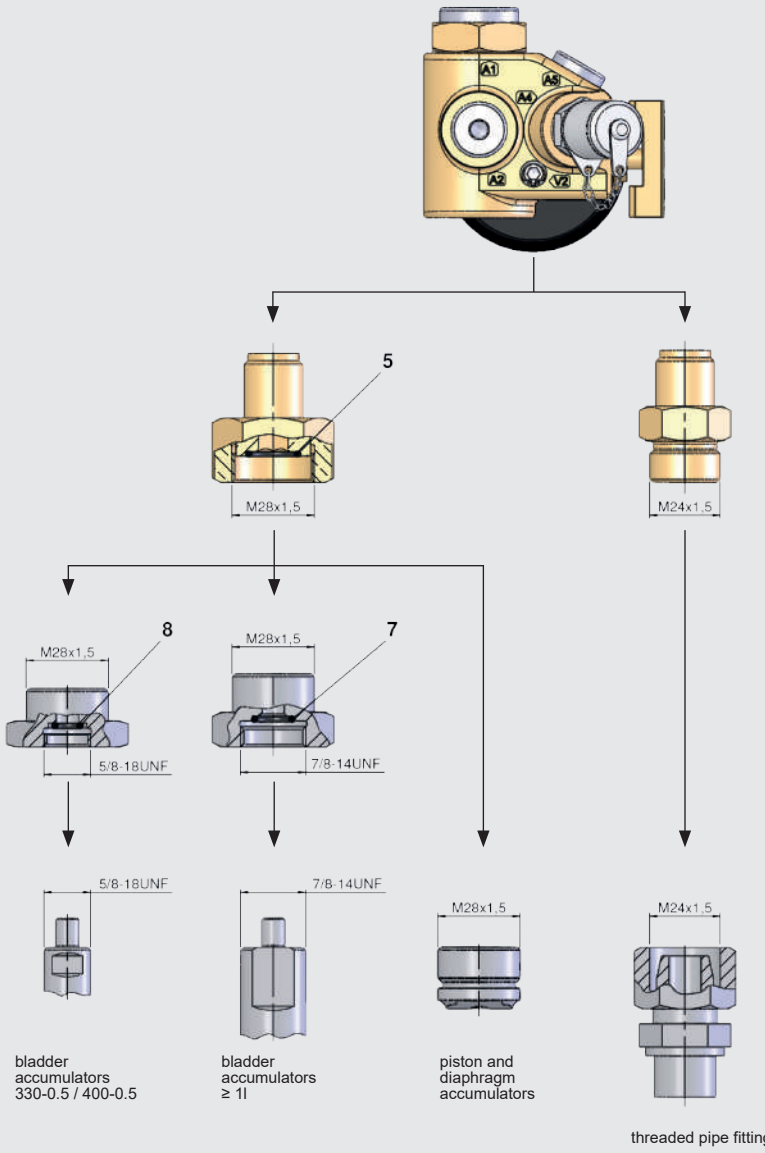
Piston and diaphragm accumulators:
M28x1.5

For piston and diaphragm accumulators the connection is a lock nut with M28x1.5 thread as standard.

Weight

- Standard design for SB
  1.6 kg
- Standard design for SBO and SK
  1.5 kg

2.4.6 Dimensions and versions



Standard model

The GSB450 is delivered with the following as standard:

- Shut-off valve
- Release valve
- Pressure gauge (0–400 bar, Ø 63 mm)
- Gas charging connection, code 1 (Minimess threaded coupling, series 1620, M16x2)

The shut-off valve (V1) must always be closed following the charging and testing procedure to protect the pressure gauge (A3), Minimess valve (A4) and pressure switch/pressure transmitter (A5) from a permanent pressure load.
The pressure side must be depressurised at the release valve (V2).
If a pressure switch/pressure transmitter for permanent monitoring of the accumulator pre-charge pressure is screwed in at connection A5, the shut-off valve (V1) must be open. We recommend the gas charging connection with code 3 for this – see also Options.

Options

The GSB450 can be supplied with the following options*:

- Special pressure gauge, e.g.
  - units other than bar/psi
  - glycerin-filled
- Minimess gas charging valve with code 3 for permanent monitoring (series 1615, M16x1.5, stainless steel version)
- Version where all steel parts are stainless steel (A4)
- Safety devices (GSV6 gas safety valve, burst disc, temperature fuse)

* On request and must be ordered separately and at additional cost

	0 - 400 bar			635143

3. PROTECTION ON THE FLUID SIDE

3.1. GENERAL

The fluid side must be protected from pressures exceeding the permitted operating pressures by installing approved and appropriate safety valves.

HYDAC offers pressure relief valves (DB12) which have a response pressure of up to 400 bar (set by HYDAC). The valve bears the CE marking, is built into safety and shut-off blocks in the series DSV10 and SAF in nominal sizes DN10 to DN50 and is lead-sealed.

Further information is available from the following catalogue section:

- SAF/DSV Safety and Shut-off Block No. 3.551

4. NOTE

The information in this brochure relates to the operating conditions and fields of application described. For applications and/or operating conditions not described, please contact the relevant technical department. Subject to technical modifications.

Mounting elements for hydraulic accumulators

1. DESCRIPTION

1.1. GENERAL

HYDAC mounting elements enable simple and secure mounting of all hydraulic accumulators. In addition to the standard product range described below, mounting technology for specific customer requirements and applications is available on request. For further information and notes, see:

- HYDAC Accessories product catalogue No. 61.000

Quick and easy – Accu-MOUNT
You can use our tool to find the matching accumulator mount, see:
www.hydac.com/Service/Online tools

1.2. APPLICATION

The optimum mounting type strongly depends on the use, type and size of the accumulator. Clamps, consoles and accumulator mounting sets are all possible options. As they are safety equipment, our mounting elements must only be attached and installed by trained staff.

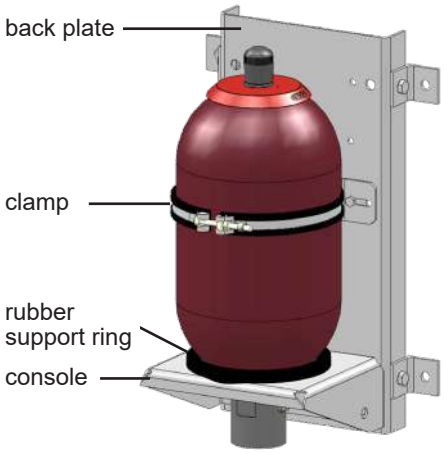
The clamp quantities for bladder and piston accumulators given in the following overviews are HYDAC recommendations that take static use and vertical mounting into account including the corresponding mounting element (e.g. HYDAC consoles).

More information on HYDAC hydraulic accumulators is available in the following catalogue sections:

- Bladder accumulators Low pressure No. 3.202
- Bladder accumulators Standard design No. 3.201
- Piston accumulators Standard design No. 3.301
- Piston accumulators SK280 No. 3.303
- Diaphragm accumulators No. 3.100
- Hydraulic accumulators with back-up nitrogen bottles No. 3.553

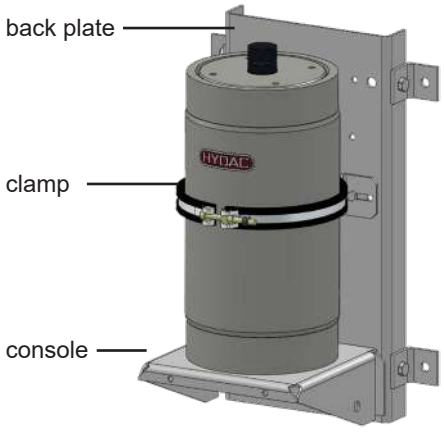
1.2.1 **Bladder accumulators**

Clamps, consoles and accumulator mounting sets can be used for optimum mounting of the bladder accumulator. The bladder accumulator console is equipped with a rubber support ring.



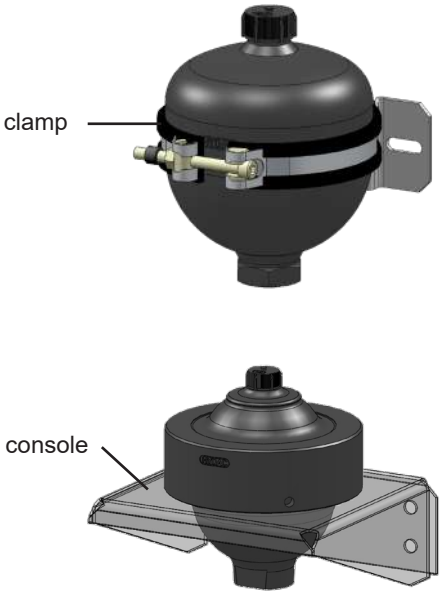
1.2.2 **Piston accumulators**

Clamps, consoles and accumulator mounting sets can also be used for piston accumulators. In this case, the console is not equipped with a rubber support ring. Please request accumulator mounting set for piston accumulators separately, as the design may vary considerably depending on the accumulator's nominal volume.



1.2.3 **Diaphragm accumulators**

Weld type diaphragm accumulators are fastened with an accumulator clamp and screw type diaphragm accumulators are fastened with a console. Accumulator mounting sets are not used for diaphragm accumulators.



1.3. MATERIALS

The following materials are available as standard:

Clamp	
Fastening, base	zinc-plated
Band clamp	stainless steel
Insert	PE/PP/NBR see section 3.1.
Console	zinc-plated
Rubber support ring [1)]	NBR
Accumulator mounting set	
Clamp	see above
Console	see above
Back plate	zinc-plated

Other materials (e.g. stainless steel) are available on request.

[1)] Only for bladder accumulators

2. SELECTION TABLES FOR MOUNTING ELEMENTS

2.1. BLADDER ACCUMULATORS AND GAS PRESSURE VESSELS

The following table shows the recommended mounting type for each series and volume. The number of clamps can vary depending on the requirements and on the length of the hydraulic accumulator and is a HYDAC recommendation (see section 1.2.).

2.2. PISTON ACCUMULATORS

The following table shows the recommended mounting type for each piston accumulator type. The clamp is selected on the basis of the accumulator's external diameter. The number of clamps can vary depending on the requirements and on the length of the hydraulic accumulator and is a HYDAC recommendation (see section 1.2.).
To prevent deformation of the cylinder, clamps should preferably be mounted near the end caps.

		Piston diameter [mm]																
		50	60		80		100		125		150		180		200	250		> 250

ACCUSET SB

1. DESCRIPTION

The HYDAC accumulator unit ACCUSET SB consists of an SB bladder accumulator, an SAF safety and shut-off block and the appropriate SEB accumulator mounting set. The parts are designed for optimum compatibility and form a compact, ready-to-install device.

This space-saving combination simplifies the connection of the hydraulic accumulator to the hydraulic system, reduces maintenance costs and considerably reduces the time and effort required for installation.

Advantages:

- Simple and secure hydraulic accumulator mounting at the installation site
- Connection of the hydraulic accumulator to a hydraulic system via a safety and shut-off block
- Protects the hydraulic accumulator from excessive pressure
- Hydraulic accumulator discharge to the tank via a pressure release valve
- Separation of the hydraulic accumulator from the system
- Two additional hydraulic connections on the shut-off block for accessories (e.g. pressure gauge).

1.1. STANDARD BLADDER ACCUMULATOR SB330

With a nominal volume of 1 ... 50 litres.

Special accumulators available on request.

See catalogue section:

- Bladder accumulators Standard design No. 3.201

1.2. SAF SAFETY AND SHUT-OFF BLOCK

In nominal sizes 10, 20 and 32, with manual or solenoid-operated/manual discharge and with the direct-acting DB12 pressure relief valve with CE marking, in accordance with the regulations of DIN EN 14359 "Gas-loaded accumulators for fluid power applications" and the European Pressure Equipment Directive (PED).

See catalogue section:

- SAF/DSV safety and shut-off block No. 3.551

1.3. SEB ACCUMULATOR MOUNTING SET

For mounting the bladder accumulator with clamps, a back plate, a console and a rubber support ring.

See catalogue section:

- Mounting elements for hydraulic accumulators No. 3.502

2. TECHNICAL DATA

2.1. SIZING

European Pressure Equipment Directive (PED) [1)]

2.2. PERMITTED OPERATING PRESSURE

330 bar [1)]

2.3. PERMITTED OPERATING TEMPERATURE OF THE HYDRAULIC ACCUMULATOR

-10 °C ... +80 °C
For standard versions (NBR, carbon steel), others on request

2.4. BLADDER MATERIAL

The bladder material must be selected in accordance with the particular operating medium or operating temperature, see section 2.9.

If discharge conditions are unfavourable (high p_2/p_0 pressure ratio, rapid discharge speed), the gas may cool to below the permitted temperature. This can cause cold cracking. The gas temperature can be calculated using the HYDAC Accumulator Simulation Program **ASP**.

2.5. PRESSURE LIMIT

DB12 set to 330 bar [1)]

2.6. RELEASE VALVE

Operating voltage 24 V DC [1)]

2.7. FLUID PORT P

See table in section 5.

2.8. SURFACE

The hydraulic accumulator is primed, the SAF block is phosphate-plated and the accumulator mounting set is zinc-plated.

See catalogue section:

- HYDAC Accumulator Technology No. 3.000
- FPU Charging and Testing Unit No. 3.501

[1)] Others on request

2.9. WORKING TEMPERATURE AND OPERATING MEDIUM

The permitted working temperature of a bladder accumulator is dependent on the application limits of the metal materials and the bladder. Outside this temperature range, special materials must be used. The operating medium must also be taken into account. The following table displays a selection of elastomer materials including max. temperature range and a rough overview of resistant and non-resistant fluids. Please contact us for help in selecting a suitable elastomer.

Materials		Material code [1]	Temperature range	Overview of the fluids [2]	
				Resistant to	Not resistant to
NBR	Acrylonitrile butadiene rubber	2	-15 °C ... + 80 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the groups HFA, HFB, HFC ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Fuels
		5	-50 °C ... + 50 °C		
		9	-30 °C ... + 80 °C		
ECO	Ethylene oxide epichlorohydrin rubber	3	-30 °C ... +120 °C	● Mineral oil (HL, HLP) ● Flame-retardant fluids from the group HFB ● Synthetic esters (HEES) ● Water ● Sea water	● Aromatic hydrocarbons ● Chlorinated hydrocarbons (HFD-S) ● Amines and ketones ● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the groups HFA and HFC ● Fuels
IIR	Butyl rubber	4	-50 °C ... +100 °C	● Hydraulic fluids from the group HFD-R ● Flame-retardant fluids from the group HFC ● Water	● Mineral oils and mineral greases ● Synthetic esters (HEES) ● Aliphatic, chlorinated and aromatic hydrocarbons ● Fuels
FKM	Fluorine rubber	6	-10 °C ... +150 °C	● Mineral oil (HL, HLP) ● Hydraulic fluids from the group HFD ● Synthetic esters (HEES) ● Fuels ● Aromatic hydrocarbons ● Inorganic acids	● Amines and ketones ● Ammonia ● Skydrol and HyJet IV ● Steam

[1] See section 3. Model code, accumulator bladder/sealing material

[2] Others on request

Temperatures exceeding this range (e.g. in the event of an external fire) can result in the hydraulic accumulator bursting. To prevent this, HYDAC can provide additional temperature fuses and burst discs, see catalogue section:

- Safety equipment for hydraulic accumulators
  No. 3.552

2.9. NOTICE

All work with HYDAC bladder accumulators or safety and shut-off blocks must only be carried out by suitably trained staff.

Incorrect installation or handling can lead to serious accidents.

The operating instructions must be observed!

- Operating instructions SB bladder accumulators
  No. 3.201.BA
- Operating instructions SAF safety and shut-off block
  No. 3.551.BA

Detailed assembly and repair instructions are available for work which may be carried out on the bladder accumulator after installation and commissioning, e.g. repair work.
No. 3.201.M

Further information such as accumulator sizing, safety information and extracts from the acceptance specifications can be found in the following catalogue section:

- HYDAC Accumulator Technology
  No. 3.000

Relevant PDF documents can be accessed at:
www.hydac.com » Downloads » Documents » Accumulator Division

3. MODEL CODE

Not all combinations are possible. Order example.
For further information, please contact HYDAC.

ACCUSET SB 330 – 10 A 1 / 1 1 2 U – 10 Y 1 – 330

Type of accumulator
SB = bladder accumulator

Series

Nominal volume [l]

Fluid port
A = standard connection

Gas valve
1 = standard version

Material of fluid port/block
1 = carbon steel
2 = stainless steel (dependent on type and pressure level)

Shell material
1 = carbon steel

Accumulator bladder/seal material
2 = NBR / NBR
3 = ECO / NBR
4 = IIR / EPDM
6 = FKM / FKM

Certification code

SAF block series

Type – poppet valve
M = manual discharge
Y = solenoid-operated and manual discharge (normally open)
Z = solenoid-operated and manual discharge (normally closed)

Type of voltage – poppet valve
1 = 24 V DC (only for Y or Z version)

Permitted operating pressure/response pressure of the pressure relief valve [bar]

Circuit diagram
